MANUFACTURES: 1909

STATISTICS OF MANUFACTURES FOR METROPOLITAN DISTRICTS

Prepared under the supervision of W. M. STEUART, Chief Statistician for Manufactures

[Reprint of pages 901-975 of Volume X of the Thirteenth Census Reports.]

INTRODUCTION.

This bulletin gives the statistics of manufactures for thirteen of the most important urban centers in the United States for the calendar year 1909, as shown by the Thirteenth Census. It has been printed as a part of Volume X of the final reports of the Thirteenth Census.

The statistics of manufactures presented in this and other census reports have certain limitations which are fully discussed in the general report on manufactures for the United States as a whole (Volume VIII of Thirteenth Census Reports).

Table 1 distributes the statistics for the group of metropolitan districts so as to show separately figures for the group of central cities and for the remaining territory of the districts. In Table 2 the statistics for the districts are combined and compared with the totals for the United States. Table 3 is a summary for the census of 1909 for each of the metropolitan districts included.

Five tables are presented in connection with the discussion of each metropolitan district, with the exception of Detroit. The first table in order summarizes the statistics of manufactures for 1909 and gives a statement of the population in 1910 for the metropolitan district, for the central city or cities, for all other incorporated places within the district having 10,000 or more inhabitants, and for the remainder of the territory. The percentage which the figures for the central city or cities represent of the total for the district is also shown. The second table is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, with percentages of increase from census to census for comparable areas. The third table gives for 1909, 1904, and 1899 the percentage which the figures for the territory outside of the central city or cities represent of the total for the district. In the fourth table statistics for 1909 are presented for the leading industries of the metropolitan district. The fifth table is a comparative summary for 1909, 1904, and 1899, showing the number of establishments, average number of wage earners, and value of products, with percentages of increase, for such of the leading industries of the district as can be shown separately, and had in 1909 products amounting to a stated minimum value.

Scope of census: Factory industries.—Census statistics of manufactures are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline.

The census of 1909, like that of 1904, was confined to manufacturing establishments conducted under the factory system, as distinguished from the neighborhood, hand, and building industries. Where statistics for 1899 are given, they have been reduced to a comparable basis by eliminating the latter classes of industries. The census did not cover establishments which were idle during the entire year, or had a value of products of less than \$500, or the manufacturing done in educational, eleemosynary, and penal institutions, or in governmental establishments.

Period covered.—The returns relate to the calendar year 1909, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the year.

The establishment.—As a rule the term "establishment" represents a single plant or mill, but in some cases it represents two or more plants which were operated under a common ownership or for which one set of books of account was kept.

If, however, the plants constituting an establishment as thus defined were not all located within the same city or state, separate reports were secured in order that the figures for each plant might be included in the statistics for the city or state in which it was located. In some instances separate reports were secured for different industries carried on in the same establishment.

Classification by industries.—The establishments were assigned to the several classes of industries according to their products of chief value. The products reported for a given industry may thus, on the one hand, include minor products very different from those covered by the class designation, and, on the other hand, may not include the total product covered by this designation, because some part of this product may be made in establishments in which it is not the product of chief value.

Selected industries.—Tables in each section give the principal facts separately for most of the leading industries of the district in question. Sometimes an industry of greater importance than some of those selected is omitted because it comprised so few establishments that these detailed presentations would reveal the operations of individual concerns.

Comparisons with previous censuses.—Owing to the changes in industrial conditions, it is not always possible to classify establishments by industries in such a way as to permit an accurate comparison with preceding censuses.

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1909 with the corresponding figures for earlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in industry.—At the censuses of 1899, 1904, and 1909 the following general classes of persons engaged in manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clerks (including other subordinate salaried employees), and (5) wage earners. In the reports for the censuses of 1904 and 1899 these five classes were shown according to the three maingroups: (1) Proprietors and firm members, (2) salaried officials, clerks, etc., and (3) wage earners. The second group included the three classes of salaried officers of corporations, superintendents and managers, and clerks. However, in this report the second, third, and fourth groups have been combined as salaried employees.

At this census the number of persons engaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. In the statistics of this report, however, no distinction is made as to sex and age. For most industries the 15th of December was selected as representing normal conditions of employment, but where conditions were exceptional and the December date could not be accepted as typical an earlier date had to be chosen.

In the case of employees other than wage earners the number thus reported on December 15, or other representative day, has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average is obtained in the manner explained in the next paragraph.

In addition to the more detailed report by sex and age of the number of wage earners on December 15, or other representative day, a report was obtained of the number employed on the 15th of each month, without distinction of sex or age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The average thus obtained represents the number of wage earners that would be required to perform the work done if all were constantly employed during the entire year. Accordingly, the importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day. The figures for wage earners in 1909 in the present bulletin are averages obtained in this manner.

In 1899 and 1904 the schedule called for the average number of wage earners of each sex 16 years of age and over, and the average number under 16 years of age without distinction of sex, for each month, and these monthly statements were combined in an annual average. Comparatively few manufacturing concerns, however, keep their books in such way as to show readily the number of men, women, and children employed on the average each month. These monthly returns by sex and age were, in fact, largely estimates. It was believed that a more accurate and reliable sex and age distribution could be secured by taking as a basis of estimate the actual numbers employed on a single day.

Capital.—For reasons stated in prior census reports, the statistics of capital secured by the census canvass are so defective as to be without value, except as indicating very general conditions. The instructions on the schedule for securing capital were as follows:

The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If land or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises.

Materials.—"Cost of materials" refers to the materials used during the year which may be more or less than the materials purchased during the year. The term "materials" includes fuel, rent of power and heat, mill supplies, and containers, as well as materials forming a constituent part of the product.

Expenses.—Under "Expenses" are included all items of expense incident to the year's business, except interest, whether on bonds or other forms of indebtedness, and allowances for depreciation.

Value of products.—The amounts given under this heading represent the selling value or price at the factory of all products manufactured during the year, which may differ from the value of the products sold. Amounts received for work on materials furnished by others are included.

Value added by manufacture.—The value of products is not a satisfactory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part of it, and often by far the larger part, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry is the value created by the manufacturing operations carried on within the industry. This value is obtained by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—Census data do not show the entire cost of manufacture, and consequently can not be used to show profits. No account has been taken of interest or depreciation. Even if the amount of profit could be determined by deducting the expenses from the value of the products, the rate of return on the investment could not properly be calculated, because of the very defective character of the figures regarding capital.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally electric, rented by them from other concerns. It does not cover the electric power developed by the primary power of the establishments themselves, the inclusion of which would evidently result in duplication.

STATISTICS OF MANUFACTURES FOR METROPOLITAN DISTRICTS.

CITIES AND THEIR SUBURBS.

The metropolitan districts for which statistics are presented in this report include not only the area within the corporate limits of the city but also parts of the surrounding territory which may in a general way be regarded as closely associated with the development of the city. Statistics as to the population of important urban centers, which are termed "metropolitan districts," have been published in the Thirteenth Census bulletin entitled "Population of Cities." and the boundaries of the districts as there defined have been adopted for the presentation of statistics relative to manufactures. Although these districts were not defined on an industrial basis, it is believed that they include most of the important factories which are intimately connected with the growth of the central cities.

In many cases manufacturing establishments of considerable size are located just outside the boundaries of cities. Such sites are purposely chosen by manufacturers who wish to secure all the advantages of an urban location, such as a plentiful supply of labor, good shipping facilities, and the like, and at the same time escape as many as possible of the expenses and restrictions which they would incur in building their plants within the city limits. The corporate limits of some cities have been extended so as to take in important manufacturing suburbs, while the boundaries of other towns have remained unchanged, although important manufacturing suburbs have developed. When city limits are established or extended the boundaries are in many instances fixed in such a way as to leave outside certain plants which would be expected to come within the city limits. Obviously, the statistics for a city alone do not always accurately represent its importance from an industrial standpoint. It follows, therefore, that the exact importance of a city as a manufacturing center can be ascertained only by combining with the statistics for establishments actually located in the city, figures for the neighboring manufacturing establishments identified or closely associated with its industrial development.

Method of defining districts.—The metropolitan district as defined for the census of 1910, in a general way consists of the city, together with the civil divisions of urban character lying within 10 miles of the city limits. Divisions which lie partly within and partly without the 10-mile limit are included if either one-half of their total population or one-half of their

total area comes within that limit. State boundaries are disregarded, so that in some cases the metropolitan district lies partly in two states. The area within the 10-mile limit thus defined is, of course, a very different thing from the area of a circle having as its radius a line extending 10 miles from the center of the city; nor is it the area bounded by a line drawn parallel to the city boundary at an exact distance of 10 miles, because in mapping out the district no civil divisions can be subdivided. Hence the outline of the area does not follow geometrical lines, but conforms to the boundaries of the political divisions which are on the outer edge of the included area. Owing to this fact, the boundaries of the adjacent territory thus defined sometimes vary considerably in their actual distance from the city lines. The area considered in this report is the net area, or land surface only.

Districts for which statistics are presented.—The statistics for 13 districts only are shown in the report, as the retabulation necessary to make a similar presentation of the figures for all metropolitan districts in the United States is impracticable. The metropolitan districts were selected for this presentation according to their population.

The central cities of the districts selected are, in the order of the importance of the districts as manufacturing centers, as follows: New York, Chicago, Philadelphia, Pittsburgh, Boston, St. Louis, Cleveland, Buffalo, Detroit, Cincinnati, Baltimore, Minneapolis and St. Paul, and San Francisco and Oakland. The districts are presented in the same order in the report.

Comparison with earlier censuses.—This report is a continuation of a similar report prepared in connection with the census of manufactures of 1904 (Bulletin 101, Industrial Districts, 1905), which contains statistics for 1904 and 1899 for 13 "industrial" districts. The central cities represented in the earlier bulletin are the same as those in the present report, except that Providence was included while Detroit was not.

Owing to the fact that different methods were employed in mapping out "metropolitan" and "industrial" districts, the area of the metropolitan district in 1909 is in most cases very different from that of the industrial district in 1904 and 1899. Since in the case of Boston a strict application of the rule used for determining metropolitan districts at the population census of 910 would have given an area almost identical with the area of the industrial district of Boston in 1904 and 1899, the latter area was for conveni-

ence of comparison considered as the metropolitan district. The same was true of New York City, except that Nassau County, and a part of the town of Rye, N. Y., which were not included in the industrial district, were added to the metropolitan district, and Maywood borough, N. J., which was in the industrial district, was not included in the metropolitan district. In the case of the other industrial districts shown in the bulletin mentioned, the areas were so different from the metropolitan districts, as determined by the application of the rule described above, that no attempt was made to secure conformity.

On account of the differences in the areas as defined for the two reports, it was deemed advisable, in compiling the tables showing totals for the districts at the various censuses, to segregate the figures for the territory added and that deducted since 1904 and to compute increases only on the basis of the figures for the area which was comprised in the district at both censuses. In the comparison of selected industries, however, it was deemed best, except for the Pittsburgh district, to make no segregation of the figures for the territory added or deducted since 1904, as only a few of these industries were greatly affected; allusions to such will be found in the text.

Summary of the statistics.—Although the main purpose of this report is to bring out the importance of the individual districts as manufacturing centers in separate sections devoted to each, some interest and significance attach to the summarized statistics as presented in Tables 1, 2, and 3. Table 1 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the 13 districts combined, for the central cities, and for the remainder of the territory comprised in these districts. The percentage which the figure for the combined cities represents of the total for all districts is shown in the case of each item.

¹ April 15, 1910.

By reference to Table 3, page 905, it will be seen that in 1909 the 13 metropolitan districts combined embraced 3,416,019 acres (approximately 5,338 square miles). Of this amount 733,158 acres represented the area of the cities and 2,682,861 acres that of the outside territory.

In 1909 the combined districts had 78,437 manufacturing establishments, which gave employment to an average of 2,789,034 persons during the year and paid out \$1,768,942,349 in salaries and wages. Of the persons employed, 2,347,718 were wage earners. These establishments turned out products to the value of \$8,658,267,349, to produce which materials costing \$5,126,778,739 were utilized. The value added by manufacture was thus \$3,531,488,610, which figure best represents the net wealth created by manufacturing operations during the year.

The percentages which the statistics for the group of central cities represent of the totals for the districts range from 59.4 per cent for primary horse-power to 85.8 per cent for proprietors and firm members. The central cities contained 75.6 per cent of the population of the districts in 1910 and contributed 73.6 per cent of the value of manufactured products in 1909.

Comparison with United States totals.—Table 2 is a summary of the statistics of manufacturing industries in 1909 and of the population in 1910 for the United States and for the group of 13 metropolitan districts, together with the percentages which this group reported of the totals for the United States.

Table 2		THIRTEE METROPOLI DISTRICTS:	TAN

¹ April 15, 1910.

Of the total number of manufacturing establishments in the United States in 1909 (268,491), 78,437, or 29.2 per cent, were in the 13 metropolitan districts, and these establishments contributed products valued at \$8,658,267,349, or 41.9 per cent of the total value of products for the United States. These districts are collectively more important from the industrial standpoint than from that of population. Their combined population represented 19.9 per cent of the

total for the United States in 1910, while the percentages for the items relating to manufactures for 1909 range from 23.8 for primary horsepower to 47.5 for salaries.

Table 3 is a detailed statement of the statistics of manufactures, population, and area, as reported at the Thirteenth Census for each of the metropolitan districts included in the report.

NEW YORK CITY METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of New York City embraces 616,928 acres of territory, of which 183,555 acres constitute the area of New York, and 433,373 acres the area of the outside territory. The population of the city of New York in 1910 was 4,766,883, and that of the outside territory 1.707,685, the total for the district being 6,474,568.

As defined at the census of 1910, the metropolitan district includes in addition to the central city 15 cities, 41 boroughs, 2 villages, 17 towns, and 17 townships. The following is a list by states and counties of the various primary divisions included in the metropolitan district for 1909. Nassau County, N. Y., and that part of Mamaroneck village, in the town of Rye, have been added to the area since 1904; and the borough of Maywood, N. J., has been deducted from it.

NEW YORK,

New York City, comprising Kings, New York, Queens, and Richmond Counties.

NASSAU COUNTY.

Hempstead town. North Hempstead town.

Oyster Bay town.

WESTCHESTER COUNTY.

Eastchester town.
Mamaroneck town.
Mamaroneck village.
Mount Vernon city.

New Rochelle city. Pelham town. Yonkers city.

NEW JERSEY.

BERGEN COUNTY.

Roselle Park borough.
Union township.

On page 906 is an outline map of the metropolitan district as constituted in 1909, showing the various primary divisions included.

Summary for the district.—Table 4 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the New York City metropolitan district, for 22 incorporated places and for the remainder of the district. The percentage which the figure for New York City represents of the total for the district is shown in the case of each item.

In 1909 the New York City metropolitan district had 31,782 manufacturing establishments, which gave employment to an average of 948,706 persons during the year, and paid out \$607,755,267 in salaries and wages. Of the persons employed, 789,175 were wage earners. These establishments turned out products

to the value of \$2,970,143,382, to produce which materials costing \$1,710,324,660 were utilized. The value added by manufacture was thus \$1,259,818,722. The New York City district ranked first in 1909 among all the metropolitan districts of the United States in the value of its manufactured products.

In the New York City district the greater part of the value of the manufactured products of the district was reported by factories within the central city, which is the leading commercial city and the industrial metropolis of the United States. New York City contained nearly three-fourths (73.6 per cent) of the population of the district in 1910, and contributed more than two-thirds (68.3 per cent) of the value of products in 1909. Its manufacturing establishments constituted over four-fifths (81.6 per cent) of all in the district and gave employment to more than seven-tenths of the wage earners (70.2 per cent).

Of the places outside of New York City for which statistics are given separately, Newark had the largest value of products in 1909, representing 6.8 per cent of the total for the metropolitan district. The population of Newark in 1910 formed 5.4 per cent of the total for the district.

. The part of the district that was outside the cities and towns for which separate figures are given, with an aggregate population equal to 4.8 per cent of the total for the district, contributed 5.7 per cent of the value of the products.

The value of the manufactured products of New York City in 1909 was nearly 60 per cent greater than was reported by Chicago, the city next in fank in this respect, and it was also greater than the value of products reported by any state other than New York, with the exception of Pennsylvania. New York City ranked first in value of products among the cities of the United States in 5 of the 15 leading manufacturing industries of the United States, namely, the making of women's clothing, with over two-thirds (69.3 per cent) of the total for the United States; the making of men's clothing, including shirts, with 38.4 per cent of the total; printing and publishing, with 24.9 per cent; the bakery industry, with 15.6 per cent; and the manufacture of tobacco products, with 15 per cent.

The 22 cities and towns in the district exclusive of New York City for which separate statistics are shown in the table together reported 26 per cent of the value of products for the district in 1909 and a somewhat lower proportion of the population in 1910—22 per cent. In these cities and towns, which are mentioned here according to rank in value of products, the leading industry or industries were as follows: Newark, the smelting and refining of copper, the tanning, currying, and finishing of leather, foundries and machine shops, the manufacture of jewelry, and the brewery industry; Jersey City, slaughtering and meat packing, the manufacture of tobacco products, the gas and soap industries, the refining of sugar, and the refining of petroleum; Bay-

onne, the refining of petroleum and smelting and refining from clippings, sweepings, and scrap; Perth Amboy, the smelting and refining of copper and the manufacture of wire; Paterson, the silk-goods industry and the dyeing and finishing of textiles; Yonkers, the refining of sugar and the manufacture of carpets and rugs; Passaic, the manufacture of woolen and worsted goods and of cotton goods; Elizabeth, the sewing-machine industry and the manufacture of wire; Hoboken and Harrison, foundries and machine shops; West New York, the refining of lard and the manufacture of cottonseed oil and cake: Orange, the manufacture of phonographs and graphophones and of fur-felt hats; Kearny, slaughtering and meat packing and the manufacture of oilcloth and linoleum; Union, the silk-goods industry; Bloomfield, the manufacture of electrical machinery, apparatus, and supplies; West Hoboken, the silk-goods industry; East Orange, the manufacture of electrical machinery, apparatus, and supplies; Mount Vernon, the manufacture of brass and bronze products; Irvington, the reducing and refining of gold and silver from clippings, sweepings, and scrap; Hackensack, the silk-goods industry; New Rochelle, printing and publishing; and Montclair, the paper-goods industry.

Considerable industrial activity was manifested in 1909 by some of the places for which statistics are not shown separately. Among these were the following, with leading industries as stated: Weehawken, the manufacture of electrical machinery, apparatus, and supplies and of wall paper; Garwood, electrical machinery, apparatus, and supplies; Lodi, the dyeing and finishing of textiles; Belleville, the manufacture of fur-felt hats and of brass and bronze products; Rahway, printing and publishing and the manufacture of steel castings; Edgewater, the chemical industry; and Nutley, the manufacture of cutlery and of artificial leather.

Comparison with earlier censuses.—Table 5 is a comparative summary of the statistics for 1909, 1904, and 1899, together with the percentages of increase.

Figures in this column used in computing percentages of increase.
 April 15, 1910.

³ State censuses of June 1, 1905.

Figures not available.

For purpose of accurate comparison the statistics for 1909 have been adjusted by segregating the figures of the territory added since 1904; and those for 1904 and 1899 by segregating the figures for the territory deducted since 1904.

The percentages of increase in all items, except average number of wage earners and miscellaneous expenses, were greater during the later five-year period 1904-1909 than during the period 1899-1904. The percentages of increase during the decade were especially large for salaries, salaried employees, and miscellaneous expenses. The average number of wage earners increased 46 per cent, wages 68 per cent, and the value of products 83.9 per cent.

The rate of increase from 1904 to 1909 in the amount of primary horsepower used was 41.6 per cent. Statistics as to the primary power used in 1899 are not available.

The proportions of the population and manufactures in the outside territory of the metropolitan district are in general increasing, as is indicated by the percentages in Table 6.

¹ Based on figures for district as constituted in 1909, exclusive of territory added since 1904.

Based on figures for district as constituted in 1904, exclusive of territory deducted since 1904.

Figures not available.

The proportion of the population of the district reported from the territory outside of New York City increased from 24.3 per cent in 1900 to 25.4 per cent in 1910; while the proportion of the value of products increased from 27.3 per cent in 1899 to 28.8 per cent in 1904 and 31.6 per cent in 1909.

Leading industries.—Table 7 (p. 911) gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the industries shown separately in the table there are 20 for which totals for the district can not be published, because to do so would disclose individual operations; and 3 which were not carried on in the part of the district which is outside the corporate

limits of New York City. In the case of all but 3 of the 20 industries of the former class the statistics shown are figures for New York City exclusively.

The leading industry of the New York metropolitan district in 1909 was the manufacture of women's clothing. The 3,058 establishments engaged in the industry there in that year reported products valued at \$270,646,086, or 9.1 per cent of the value of products of all industries in the district. The manufacture of men's clothing, including shirts, ranked next, with 2,630 establishments and products valued at \$224,-943,048, or 7.6 per cent of the total. Other important industries, with the value of their products, were: Printing and publishing, \$194,486,953; slaughtering and meat packing, \$131,081,148; foundries and machine shops, \$107,297,665; the manufacture of tobacco products, \$78,783,942; the bakery industry, \$77,-472,491; the manufacture of silk goods, including the operations of throwsters, \$74,570,282; the brewery industry, \$72,850,405; the making of millinery and lace goods, \$56,072,956.

Among the more important industries that can not be shown separately without disclosing the operations of individual establishments are the smelting and refining of copper, the refining of sugar, the refining of petroleum, the roasting and grinding of coffee, the smelting and refining of lead, the manufacture of carpets and rugs other than rag, of wire, of flour-mill and gristmill products, and of sewing machines and attachments, lapidary work; the manufacture of lead pencils, of oilcloth and linoleum, and the distillation of liquors. Four of these had products in 4909 valued at very much more than \$10,000,000.

Comparative summary, by industries.—The number of establishments, average number of wage earners. and value of products for such of the industries as can be shown separately and had a value of products amounting to \$10,000,000 or more in 1909 are given in Table 8 (p. 913) for the district as constituted in 1909, 1904, and 1899, respectively.

The greatest absolute increase in value of products shown for any single industry during the decade, amounting to \$165,984,908, or 158.6 per cent, was that for the women's clothing industry. The greatest relative increase for any of the industries included in the table, 673.4 per cent, was reported for smelting and refining from clippings, sweepings, and scrap.

An important industry not given in the comparative table is the manufacture of men's furnishing goods. At the censuses of 1904 and 1899 some of the establishments reporting as chief products suspenders, garters, and elastic woven goods were excluded from this industry. As it is not practicable to segregate these establishments, no proper comparison is possible.

6 Comparable figures not available.
7 Excluding statistics for two establishments, to avoid disclosure of individual operations.
8 Excluding statistics for one establishment, to avoid disclosure of individual operations.
9 Excluding statistics for eight establishments, to avoid disclosure of individual operations.
10 Excluding statistics for three establishments, to avoid disclosure of individual operations.

MANUFACTURES.

CHICAGO METROPOLITAN DISTRICT: 1909.

CHICAGO METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Chicago embraces 409,087 acres of territory, of which 118,433 acres constitute the area of Chicago and 290,654 acres the area of the outside territory. The population of the city of Chicago proper in 1910 was 2,185,283, and that of the outside territory 261,638, the total for the district being 2,446,921.

As defined at the census of 1910, the metropolitan district includes the central city, together with Berwyn. Bloom, Calumet, Cicero, Evanston, Leyden, Lyons, Maine, New Trier, Niles, Norwood Park, Oak Park, Proviso, Ridgeville, Riverside, Stickney, Thornton, and Worth townships, all in Cook County, Ill., and Calumet and North townships in Lake County, Ind. Within these townships, or coextensive with them, there are seven incorporated places of 10,000 or more inhabitants. Of these four are in Illinois, namely, Chicago Heights city, in Bloom township; Cicero town, coextensive with Cicero township; Evanston city, coextensive with Ridgeville township: and Oak Park village, coextensive with Oak Park township. The remaining three, which are in Indiana. are East Chicago city and Hammond city, both in North township; and Gary city in Calumet township.

The territory comprised within the Chicago industrial district as constituted for the bulletin on industrial districts for 1904 did not include Bloom township, which contains Chicago Heights city, or Maine township, or the townships and incorporated places in Indiana; but it comprised, in addition to the territory represented by the other places mentioned above, Downers Grove and York townships in Dupage County, Ill., and Palos township in Cook County, Ill.

The relative location of the constituent divisions is indicated on the outline map of the district (p. 914).

Summary for the district.—Table 9 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Chicago metropolitan district, for the city of Chicago; for six of the seven other incorporated places within the district which had over 10,000 inhabitants in 1910—four cities, one town, and one village—and for the remainder of the district. The percentage which the figure for Chicago represents of the total for the district is shown in the case of each item. The statistics for Gary, Ind., are included in the "remainder" of the district to avoid disclosing the operations of individual establishments.

¹ Includes Gary, Ind., the statistics for which can not be shown without disclosing individual operations.

² April 15, 1910.

In 1909 the Chicago metropolitan district had 10,202 manufacturing establishments, which gave employment to an average of 393,859 persons during the year and paid out \$266,626,915 in salaries and wages. Of the persons employed 325,924 were wage earners. These establishments turned out products to the value of \$1,408,779,818, to produce which materials costing \$870,586,561 were utilized. The value added by manufacture was thus \$538,193,257. The Chicago

district ranked second in 1909 among all the metropolitan districts of the United States in the value of its manufactured products. It far exceeded any of them in the value of products of the slaughtering and meat-packing industry.

In the Chicago district, as in all but two of the districts, the greater part of the value of the manufactured products of the district was reported by factories within the central city. Chicago contained nearly

nine-tenths (89.3 per cent) of the population of the district, of which it is the manufacturing, commercial, and financial center, and contributed over nine-tenths (90.9 per cent) of the value of products. Its manufacturing establishments constituted 94.6 per cent of all in the district, and gave employment to 90.2 per cent of the average number of wage earners for that area.

Of the places outside Chicago for which statistics are given separately, Hammond reported the largest value of products, but this value represented only 1.1 per cent of the total for the metropolitan district. The population of this city formed only nine-tenths of 1 per cent of the total in the district.

The area comprised within the 17 townships, or parts of townships, outside of incorporated places having more than 10,000 inhabitants, included in the district, together with Gary city, for which statistics can not be shown separately without disclosing the operations of individual establishments, had a combined population equal to 6.1 per cent of the total for the district and contributed 6.3 per cent of the value of its products. The average value of products per establishment for this group was much greater than that for any of the places shown separately, except East Chicago and Hammond.

The leading industries in Chicago Heights in 1909 were foundries and machine shops, steel works and rolling mills, and steam-railroad car construction shops. The principal industry of Evanston was the

manufacture of wrought iron and steel pipe. In Cicero foundries and machine shops and the manufacture of wrought iron and steel pipe constituted the most important industries. The production of illuminating gas occupied first place in Oak Park. In Gary, Ind., three establishments—a steel plant, a blast furnace, and a cement factory, named in the order of their importance—together contributed nearly the total value of the manufactured products of the city. The principal industries of Hammond were distilleries, steam-railroad repair shops, and foundries and machine shops. The manufacture of iron and steel was the leading industry in East Chicago. An important industrial place for which the statistics are not shown separately is Indiana Harbor, Ind., with large steel works and rolling mills.

Comparison with earlier censuses.—Table 10 gives statistics for the district for 1909, 1904, and 1899. For purposes of comparison the statistics in this table are grouped in such a way as to show separately for 1909 figures for (1) the territory added to the district since 1904 (Bloom and Main townships in Illinois and Calumet and North townships in Indiana) and (2) the remainder of the district; and for 1904 and 1899 figures for (1) the territory deducted since 1904 (Downers Grove, York, and Palos townships in Illinois) and (2) the remainder of the district. Percentages of increase are shown only for the territory which was included in the district in both 1909 and 1904.

¹ Figures in this column used in computing percentages of increase. ² April 15, 1910. ⁸ No population census in 1905. ⁴ June 1, 1900. ⁶ Figures not available.

In the area for which comparisons are made the percentages of increase in all the items shown, except one, for the three census years were larger during the more recent five-year period 1904–1909 than during the period 1899–1904. During the decade as a whole the rate of increase was much greater in salaries and capital than in any other items. The average number of

wage earners increased 35.5 per cent during this period and the amount paid for wages 64.3 per cent, a rate of gain approximately equal to that in value of products (62.5 per cent). The rate of increase in primary horsepower of all kinds from 1904 to 1909 was 45.2 per cent. Statistics as to the primary power used in 1899 are not available.

The proportions of the population and manufactures in the outside territory of the metropolitan district are constantly increasing, as is indicated by Table 11.

Table 11	PER CENT OF CHICA DISTRICT.	TERRITORY GO IS OF T	OUTSIDE OTAL FOR

¹ Based on figures for district as constituted in 1909, exclusive of territory added since 1904.

Based on figures for district as constituted in 1904, exclusive of territory deducted since 1904.

No population census in 1905.

Figures not available.

The proportion which the population outside Chicago, but within the area comprised in the district, in each census year formed of the total in that area increased from 5.8 per cent in 1900 to 7.2 per cent in 1910, and the proportion of the value of products of that area that was contributed by the outlying territory increased from 1 per cent in 1899 to 1.6 per cent in 1904, and to 2.2 per cent in 1909.

Leading industries.—Table 12 gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the industries shown separately in the table there are 23 for which totals for the district can not be published, because to do so would disclose individual operations; and 26 which were not carried on in the part of the district which is outside the corporate limits of Chicago. In all these cases the statistics shown are figures for Chicago exclusively.

The predominant industry of the Chicago metropolitan district is slaughtering and meat packing. The figures shown for this industry are for Chicago exclusively, one small establishment in 1909 engaged in the manufacture of sausage in the territory outside Chicago being excluded to avoid disclosing the operations of individual concerns. The 67 establishments in Chicago in 1909 reported products valued at \$325,061,657, or 23.1 per cent of the value of products of all industries in the district. Other important industries were foundries and machine shops, with a value of products amounting to \$104,319,563; the making of men's clothing, including shirts, with products valued at \$85,296,407; printing and publishing, with products valued at \$76,070,564; and steel works and rolling mills, with products valued at \$71,531,974.

The value of products shown for establishments engaged in the manufacture of electrical machinery, apparatus, and supplies, and of copper, tin, and sheetiron products is much less than the actual figures for these industries in the district, statistics for the establishments outside of Chicago having been omitted in order to avoid disclosing the operations of individual concerns.

The greatest absolute increase during the decade in value of products shown for any individual industry included in the table was for slaughtering and meat packing—\$67,791,506, or 26.4 per cent; the greatest relative increase for any single industry (178.2 per cent) was reported for the lumber industry.

The blast-furnace industry, the manufacture of agricultural implements, the smelting and refining of lead, the gas industry, the refining of petroleum, and the manufacture of cordage and twine and jute and linen goods, of flour and grist mill products, of distilled liquors,

of oleomargarine, of cement, and of glucose and starch are among the important industries in the district that can not be shown separately, as to do so would disclose individual operations. They are mentioned in the order of their importance.

The inclusion, in this comparative table, of the 1909 statistics for industries in the territory added since 1904 raises very much the total value of products of steel—"iron and steel, steel works and rolling mills," and of musical instruments, pianos and organs and materials.

¹ A minus sign (—) denotes decrease. Percentage not shown where base is less than 100 for wage earners.
2 Excluding statistics for one establishment, to avoid disclosure of individual operations.
3 Comparable figures not available.
4 Includes "bookbinding and blank-book making;" "engraving, steel and copper plate, including plate printing;" and "lithographing."
5 Excluding statistics for five establishments, to avoid disclosure of individual operations.
6 Excluding statistics for two establishments, to avoid disclosure of individual operations.
7 Excluding statistics for twenty-two establishments, to avoid disclosure of individual operations.

PHILADELPHIA METROPOLITAN DISTRICT.

Territory included .- The metropolitan district of Philadelphia embraces 437,733 acres of territory, of which 83,340 acres represent the area of Philadelphia. and 354,393 acres the area of the outside territory. The population of the city of Philadelphia proper in 1910 was 1,549,008, and that of the outside territory 423,334, the total for the district being 1,972,342.

As defined at the Thirteenth Census, the metropolitan district comprised, in addition to the city of Philadelphia, 6 cities, 42 boroughs, and 49 townships—a total of 97 civil divisions. Five of the cities, 11 of the boroughs, and 17 of the townships are situated in New Jersey. The district covered by the statistics published in the bulletin on industrial districts for 1904 contained, besides Philadelphia, 68 civil divisions, all but 8 of which are among the number included for 1909. These 8 divisions comprise Southampton township in Bucks County, Pa.; Thornbury and Willistown townships in Chester County, Pa.: and Bethel, Birmingham, Concord, Edgemont, and Thornbury townships in Delaware County, Pa.

The various cities, boroughs, and townships included in the metropolitan district in 1909 are shown below, by counties. Places included in the district in 1904 are indicated by (*):

PENNSYLVANIA.

PHILADELPHIA COUNTY.

*Philadelphia city.

BUCKS COUNTY.

Wenonah borough. West Deptford township. Woodbury city.

On page 920 is an outline map of the metropolitan district as constituted in 1909, showing the various cities, boroughs, and townships included.

Summary for the district.—Table 14 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Philadelphia district; for the cities of Philadelphia. Pa., Camden, N. J., and Chester, Pa., and the borough of Norristown, Pa.; and for the remainder of the district. The percentage which the figure for Philadelphia represents of the total for the district is shown in the case of each item.

In 1909 the Philadelphia metropolitan district had 9.568 manufacturing establishments, which gave employment to an average of 358,218 persons during the year, and paid out \$200,933,659 in salaries and wages. Of the persons employed, 308,947 were wage earners. These establishments turned out products to the value of \$911,014,010, to produce which materials costing \$529,992,413 were utilized. The value added by manufacture was thus \$381,021,597. The Philadel-

phia district ranked third in 1909 among all the metropolitan districts of the United States in the value of its manufactured products.

¹ April 15, 1910.

The greater part of the value of the manufactured products of the district was reported by factories within the central city. Philadelphia contained over three-fourths (78.5 per cent) of the population of the district in 1910, and contributed over four-fifths (81.9 per cent) of the value of manufactured products for 1909. Its manufacturing establishments constituted 87.6 per cent of the total number of such establishments in the district and gave employment to 81.5 per cent of the average number of wage earners for that area.

Of the places outside of Philadelphia for which statistics are given separately, Camden, N. J., had the largest value of manufactured products in 1909, representing 5.4 per cent of the total for the metropolitan district. The population of Camden was 4.8 per cent of the total for the district in 1910.

The group of cities, boroughs, and townships not shown separately, with a combined population equal to 13.3 per cent of the total for the district, contributed 9.7 per cent of the value of products.

The principal industries of Philadelphia in 1909, as measured by value of products, were the woolen and worsted goods industry, printing and publishing, the refining of sugar, foundries and machine shops, the making of women's clothing and of men's clothing, including shirts, and petroleum refining; of Camden, the tanning, currying, and finishing of leather, and shipbuilding; of Chester, the metal-working and textile industries; and of Norristown, the hosiery and knitgoods industry. A large number of other places in the district, statistics for which are not given separately, reported manufactured products ranging from approximately \$1,200,000 to \$10,000,000 in value in 1909. These places included, in Pennsylvania, Eddystone borough, with foundries and machine shops and tex-

tile dyeing and finishing works; Lower Merion township, with steel works and structural iron plants; Bristol borough, with leather and woolen factories; Marcus Hook borough, with petroleum refineries; Conshohocken borough, with steel works; Clifton Heights and Bridgeport boroughs, with woolen factories; Ambler borough, with plants manufacturing steam packing; and Upper Darby township, with flour mills and gristmills. In New Jersey, the places that reported a large value of products included Gloucester city, with factories manufacturing gas and lamp fixtures; Riverside township, with the manufacture of watch cases; and Burlington city and Florence township, with plants manufacturing cast-iron and steel pipe.

Comparison with earlier censuses.—Table 15 gives statistics for the district for 1909, 1904, and 1899, together with the percentages of increase from census to census. For purposes of accurate comparison the statistics for 1909 have been adjusted by segregating the figures for the territory added since 1904; and those for 1904 and 1899 by segregating the figures for the territory deducted since 1904.

The percentage of increase in all items shown except miscellaneous expenses was greater during the later five-year period 1904–1909 than during the period 1899–1904. For the decade 1899-1909 the relative increase was greater in the amount paid for salaries and in the number of salaried employees than for any other items. The average number of wage earners increased 23.2 per cent during this period, but the wages increased 40.3 per cent, a rate of gain somewhat less than that in value of products, 51.3 per cent. The rate of increase in primary horsepower of all kinds from 1904 to 1909 was 27.6 per cent. Statistics as to the primary power used in 1899 are not available.

April 15, 1910.
 No population census of Pennsylvania in 1905.

The proportion of manufactures in the outside territory of the metropolitan district is constantly increasing, as is indicated by Table 16. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904, and those for 1904 and 1899 upon the figures for the district exclusive of the territory subsequently deducted.

¹ Based on figures for district as constituted in 1909, exclusive of territory added since 1904.

2 Based on figures for district as constituted in 1904, exclusive of territory

The proportion of the population of the district as originally constituted reported for the territory outside of Philadelphia increased from 15.6 per cent in 1900 to 16.5 per cent in 1910, and the proportion of the value of products contributed by the outlying terri-

tory increased steadily, from 10.8 per cent in 1899 to 12.7 per cent in 1904 and 15.4 per cent in 1909.

Leading industries.—Table 17 gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the 101 industries shown separately in the table, there are 17 for which the totals for the district can not be given without disclosing individual operations and 18 which were not carried on in 1909 in the part of the district that is outside the city limits. In the case of all these industries, with the exception of one in the former group, the statistics shown are figures for Philadelphia only.

Of the industries shown separately, the woolen and worsted goods industry ranked highest in value of products in 1909, with 8.4 per cent of the total reported for all industries in the district, followed by foundries and machine shops, with 6.5 per cent of this total, and printing and publishing, with 5.1 per cent. Two industries-the men's clothing and cotton-goods industries-each contributed 3.2 per cent of the total value of products for the district, the making of women's clothing exceeding them slightly, with 3.3 per cent. These small percentages tend to show the great total value of the manufactures, as well as their large variety. The industries in which this, the third greatest metropolitan district, led all other districts in 1909 were the manufacture of carpets and rugs, of furfelt hats, and of hosiery and knit goods.

¹ A minus sign (—) denotes decrease.
2 Excluding statistics for two establishments, to avoid disclosure of individual operations.
3 Excluding statistics for one establishment, to avoid disclosure of individual operations.
4 Comparable figures not available.
5 Includes "printing and publishing, music;" "bookbinding and blank-book making;" "engraving, steel and copper plate, including plate printing:" and "lithographing."

The greatest absolute increase in value of products during the decade in the area under consideration—\$33,423,596, or 78 per cent—is shown for the manufacture of woolen, worsted, and felt goods and wool hats. In this industry the city of Philadelphia ranks second among cities of the United States. The omission of the statistics for one establishment in 1899 has only the slightest effect upon the comparison.

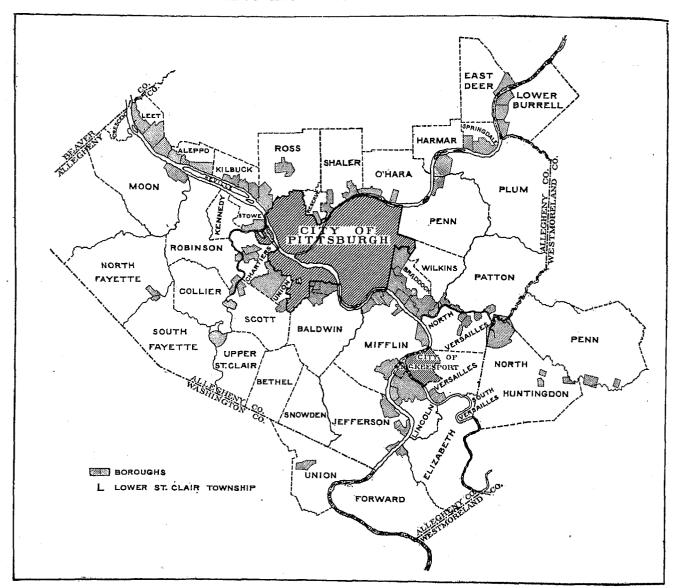

The apparent decrease for the dyeing and finishing of textiles is due to the necessary omission of statistics for two establishments, to present which would disclose the operations of individual establishments. In reality there has been a very considerable increase.

Among the important industries that can not be shown separately, since to do so would disclose the operations of individual establishments, are the refining of sugar and of petroleum, the shipbuilding indus-

try, and the manufacture of locomotives and of oilcloth and linoleum.

The relative gain shown in the table for the manufacture of steam packing is much increased by the inclusion of statistics for this industry from territory added to the district since 1904. The absolute gain in the manufacture of woolen, worsted, and felt goods and wool hats is likewise considerably raised by figures for that part of the industry reported from territory new to the district in 1909. Other prominent industries affected in substantially like measure as the latter are the tanning, currying, and finishing of leather and the manufacture of steel. Omitting from consideration these industries, the greatest relative gain in value of products during the decade was for food preparations, 416.3 per cent; and in absolute gain, for the manufacture of clothing—\$27,640,483.

PITTSBURGH METROPOLITAN DISTRICT: 1909.

PITTSBURGH METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Pittsburgh embraces 405,880 acres of territory, of which 26,511 acres constitute the area of Pittsburgh and 379,369 acres the area of the outside territory. The population of the city of Pittsburgh proper in 1910 was 533,905 and that of the outside territory 510,838, the total for the district being 1,044,743. As defined at the census of 1910, the metropolitan district comprised 119 cities, boroughs, and townships situated in Allegheny, Washington, and Westmoreland Counties; the district covered by the statistics published for 1904 contained only 58 civil divisions, all of which were in Allegheny County.

The following is a list, by counties, of the various cities, boroughs, and townships included in the metropolitan district in 1909:

[Places included in the district in 1904 are indicated by*. Allegheny, Elliott, Esplen, Montooth, Sheraden, Sterrett, and West Liberty, included in 1904 as separate subdivisions, are now part of the city of Pittsburgh.]

The relative location of the constituent divisions is indicated on the outline map of this district on page 928.

Summary for the district.—Table 19 is a summary for 1909 of the statistics of manufacturing industries. with a statement of the population, for the Pittsburgh metropolitan district; for the cities of Pittsburgh and McKeesport, and five of the leading boroughs; and for the remainder of the district. The percentage which the figure for Pittsburgh represents of the total for the district is shown in the case of each item. The statistics for Duquesne and North Braddock boroughs are included with the "remainder" of the district to avoid disclosing individual operations.

In 1909 the Pittsburgh metropolitan district had 2,369 manufacturing establishments, which gave employment to an average of 163,258 persons during the year and paid out \$115,049,924 in salaries and wages. Of the persons employed 140,464 were wage earners. These establishments turned out products to the value of \$578,815,493, to produce which materials costing \$366,892,433 were utilized. The value added by manufacture was thus \$211,923,060. The Pittsburgh district ranked fourth in 1909 among all the metropolitan districts of the United States in the value of its manufactured products. It far exceeded any of the others in the value of its iron and steel output.

In the Pittsburgh district, as in the Boston district, the greater part of the value of the manufactured products of the district was reported by factories outside the central city. Pittsburgh contained over one-half (51.1 per cent) of the population of the district of which it is the manufacturing, commercial, and financial center, and contributed slightly over two-fifths of the value of products for the district (42.1 per cent). Its manufacturing establishments constituted seventenths (70 per cent) of all in the district and gave employment to nearly one-half (48.8 per cent) of the average number of wage earners for that area. Of the places outside Pittsburgh for which statistics are given separately, McKeesport had the largest value of products, representing 7.3 per cent of the total for the metropolitan district. This city contained 4.1 per cent of the total population of the district.

¹ Includes Duquesne and North Braddock, the statistics for which can not be shown without disclosing individual operations.

² April 15, 1910.

The group of 112 boroughs and townships, which are not shown separately, with a combined population equal to 37 per cent of the total for the district, contributed 47.3 per cent of the value of its products. The average value of products per establishment for this group of places was much greater than that reported by any of the places shown separately, except McKeesport. A number of the places in this group had a larger output of iron and steel than some of the places for which separate figures are given. Munhall, which adjoins the borough of Homestead, is conspicuous in this regard, followed in importance accord-

ing to the value of iron and steel products by Bessemer, Duquesne, Rankin, Clairton, and Etna.

Comparison with earlier censuses.—Table 20 is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census. For purposes of comparison with the statistics for the district as given for 1904¹ and 1899, the totals for 1909 are segregated into figures for the territory added since 1904, and into those for the remainder of the district.

¹ Bureau of Census: Industrial Districts, 1905, p. 38.

¹ A minus sign (—) denotes decrease. ² Figures in this column used in computing percentages of increase.

The percentages of increase in value of products and value added by manufacture were greater during the more recent five-year period, 1904–1909, than during the period 1899–1904, but the number of wage earners and salaried employees and the expenditures for services increased at a more rapid rate during the

earlier than during the later period. The percentages of increase during the decade 1899–1909, were much larger in the number of salaried employees and in salaries than for any other items. The average number of wage earners increased only 17.5 per cent during this period, but the wages paid increased 36.7 per cent,

April 15, 1910.
 No population census in 1905.

⁵ June 1, 1900. ⁶ Figures not available.

a rate of gain approximately equal to that in value of products, 37.1 per cent. The relative increase in primary horsepower of all kinds from 1904 to 1909 was 9.1 per cent. Statistics as to the primary power used in 1899 are not available.

The proportions of the population and manufactures in the outside territory of the metropolitan district are constantly increasing as is indicated by the percentages in Table 21. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904.

The proportion of the population of the district as originally constituted that was reported from the territory outside of Pittsburgh, increased from 27.6 per cent in 1900 to 33.8 per cent in 1910, and the proportion of the value of products of that district that was contributed by the outlying territory increased steadily from 35.8 per cent in 1899 to 44.9 per cent in 1904, and to 47.8 per cent in 1909.

¹ Excluding statistics for establishments located outside of the corporate limits of Pittsburgh, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

The predominant industry of the Pittsburgh metropolitan district is the manufacture of iron and steel. The products of steel works and rolling mills in this district in 1909 were valued at \$237,186,077, of which Pittsburgh 1 alone reported \$82,306,627; the output of blast furnaces was valued at \$85,584,235, Pittsburgh contributing \$20,668,023. The products of the foundries and machine shops had a value of \$52,411,013, of which \$21,690,645 was reported by Pittsburgh. In each instance, therefore, the territory outside the city contributed by far the greater part of the total for the district.

The combined product of steel works and rolling mills and of blast furnaces in the entire district had an aggregate value of \$322,770,312, or 55.8 per cent of the value of products for all industries in the district and 23.4 per cent of the value of products of these two branches of the iron and steel industry in the United States. By adding the value of products of the foundries and machine shops, \$52,411,013, the total becomes \$375,181,325, or 64.8 per cent of the total value of products for all industries in the district, Of this combined total, Pittsburgh alone contributed \$124,665,295, or 21.5 per cent.

Other prominent industries were the manufacture of electrical machinery, apparatus, and supplies, with products valued at \$20,260,163; steam-railroad repair shops, with products valued at \$16,804,878; and slaughtering and meat packing, with products valued at \$14,492,440.

The manufacture of coke is omitted from the table as to include it would disclose the operations of individual establishments.

Comparative summary, by industries.—The number of establishments, average number of wage earners, and value of products for such of the industries as can be shown separately and had a value of products amounting to \$2,000,000 or over in 1909, are given in Table 23 for the district as constituted in 1904 and 1899.

COMPARATIVE SUMMARY FOR THE PITTSBURGH METROPOLITAN DISTRICT, BY SELECTED INDUSTRIES: 1909, 1904, AND 1899.

The greatest absolute increase in value of products during the decade in the area under consideration is shown for the manufacture of iron and steel, by steel works and rolling mills and blast furnaces-\$65,-705,888, or 32 per cent. The greatest relative increase. 334.2 per cent, was reported for cars and general shop construction and repairs by steam-railroad companies. The manufacture of electrical machinery, apparatus, and supplies is an important industry in this district, but the statistics can not be given in this

table, as to do so would disclose individual operations. Other important industries not shown separately, for the same reason, in this table are, in the order of their importance, the manufacture of iron and steel bolts, nuts, washers, and rivets, not made in steel works or rolling mills; confectionery; springs, steel, car and carriage; and liquors, distilled. Smelting and refining, not from the ore, is also omitted, because comparable figures for 1904 can not be given without disclosing individual operations.

BOSTON METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Boston embraces 335,905 acres of territory, of which 26,289 acres constitute the area of Boston and 309,616 acres the area of the outside territory. The population of the city of Boston proper in 1910 was 670,585, and that of the outside territory 849,885, the total for the district being 1,520,470.

As defined for the three censuses, the metropolitan district comprised 14 cities and 33 towns, as follows:

SUFFOLK COUNTY.

Boston city. Chelsea city.

Revere town.
Winthrop town.

ESSEX COUNTY.

Lynn city.
Marblehead town.
Nahant town.
Peabody town.

Salem city. Saugus town. Swampscott town.

MIDDLESEX COUNTY.

Arlington town.
Belmont town.
Cambridge city.
Everett city.
Framingham town.
Lexington town.
Lincoln town.
Malden city.
Medford city.
Melrose city.
Natick town.

Newton city.
Sherborn town.
Somerville city.
Stoneham town.
Wakefield town.
Waltham city.
Watertown town.
Wayland town.
Weston town.
Winchester town.
Woburn city.

NORFOLK COUNTY.

Braintree town.
Brookline town.
Canton town.
Dedham town.
Dover town.
Hyde Park town.
Milton town.

Needham town.
Norwood town.
Quincy city.
Randolph town.
Wellesley town.
Westwood town.
Weymouth town.

On page 935 is an outline map of the metropolitan district as constituted in 1909, showing the various cities and towns included.

Summary for the district.—Table 24 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Boston metropolitan district; for the cities of Boston, Cambridge, Chelsea, Everett, Lynn, Malden, Medford, Melrose, Newton, Quincy, Salem, Somerville, Waltham, and Woburn, and the towns of Arlington, Brookline, Framingham, Hyde Park, Peabody, Revere, Wakefield, Watertown, Weymouth, and Winthrop; and for the remainder of the district. The percentage

which the figure for Boston represents of the total for the district is given in the case of each item.

In 1909 the Boston metropolitan district had 5,389 manufacturing establishments, which gave employment to an average of 214,641 persons during the year, and paid out \$132,394,865 in salaries and wages. Of the persons employed, 185,952 were wage earners. These establishments turned out products to the value of \$564,054,506, to produce which materials costing \$315,770,540 were utilized. The value added by manufacture was thus \$248,283,966. The Boston district ranked fifth in 1909 among all the metropolitan districts of the United States in the value of its manufactured products.

In the Boston district, as in the Pittsburgh district, the greater part of the value of the manufactured products of the district was reported by factories outside the central city. Boston contained less than one-half (44.1 per cent) of the population of the district of which it is the manufacturing, commercial, and financial center, and contributed a little more than two-fifths (42.1 per cent) of the value of products. Its manufacturing establishments constituted nearly three-fifths (58.5 per cent) of all in the district, and gave employment to a little more than one-third of the wage earners (37.4 per cent).

Of the places outside of Boston for which statistics are given separately, Lynn had the largest value of products, representing 12.7 per cent of the total for the metropolitan district; but it contained only 5.9 per cent of the total population.

The group of 23 towns that are not shown separately, each having less than 10,000 inhabitants, had a combined population of 8 per cent of the total for the district and contributed 6 per cent of the value of the products.

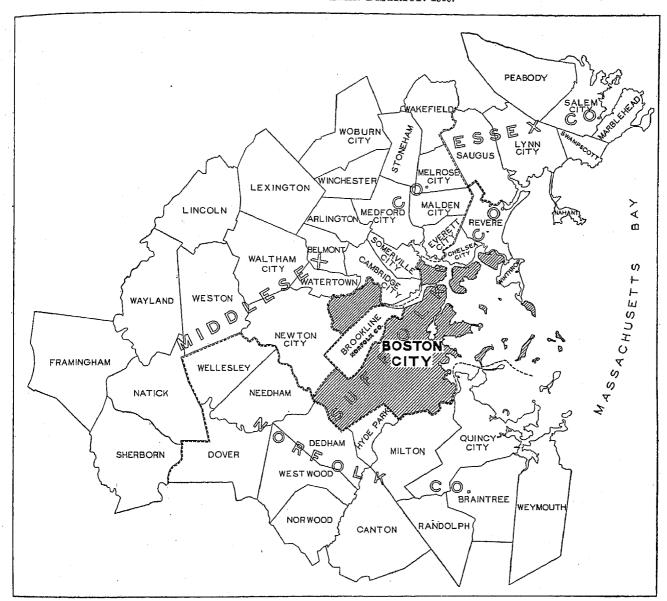

The principal industries of Boston in 1909, as measured by value of products, were printing and publishing and the manufacture of boots and shoes, of clothing, of foundry and machine shop products, and of confectionery. The leading industry of Lynn was the manufacture of boots and shoes, in which it led all other places in the United States. The leading industries of Cambridge were foundry and machine shop products, printing and publishing following; of Somerville, slaughtering and meat packing; of Chelsea, rubber goods; of Peabody, the tanning, currying, and finishing of leather; of Salem, boots and shoes; of Watertown, rubber boots and shoes; and of Quincy, shipbuilding.

BOSTON METROPOLITAN DISTRICT: 1909.

Comparison with earlier censuses.—Table 25 is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census.

The percentages of increase in average number of wage earners and in wages and miscellaneous expenses—and for total expenses—value of products, and value added by manufacture, were greater during the earlier five-year period, 1899-1904, than during the period 1904-1909. For the decade as a whole the relative increase was greatest in the amounts paid for salaries and for miscellaneous expenses, and in the number of salaried employees. The average number of wage earners increased 41.3 per cent and the amount paid for wages 57 per cent, a gain approximately equal to that in value of products—59.4 per cent. The relative increase in primary horsepower of all kinds from 1904 to 1909 was 38.2 per cent. Statistics as to the primary power used in 1899 are not available.

¹ Figures not available.

The proportion of the population of the district reported from the territory outside of Boston increased from 55.1 per cent in 1900 to 55.9 per cent in 1910, while the proportion of the value of products increased from 54 per cent in 1899 to 57.9 per cent in 1909.

Leading industries.—Table 27 gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

The manufacture of boots and shoes is the leading industry in the Boston district. The value of the products in 1909 amounted to 18.3 per cent of the value of the products for all industries. Two industries—printing and publishing and slaughtering and meat packing—each contributed 6.3 per cent of the value of products for the district; and two others—leather, tanned, curried, and finished, and foundry and machine-shop products—5.8 per cent and 5.3 per cent, respectively.

¹ Excluding statistics for establishments located outside the corporate limits of Boston, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

Comparative summary, by industries.—The number of establishments, average number of wage earners, and value of products for such of the industries as can be shown separately and have a value of products amounting to \$4,000,000 or more in 1909, are given in Table 28 for the district for 1909, 1904, and 1899.

The greatest absolute increase in value of products during the decade—\$51,869,122, or 101 per cent—is

shown for boots and shoes. The greatest relative increase, 220.3 per cent, was reported for the manufacture of hosiery and knit goods. Among the more important industries that can not be shown at all in any tables are, in the order of their importance, sugar refining, the rubber boot and shoe industry, and the manufacture of chocolate and cocoa products, of rubber goods, of rubber and woven belting and hose, of clocks and watches, and of paper and wood pulp.

MANUFACTURES.

COMPARATIVE SUMMARY FOR THE BOSTON METROPOLITAN DISTRICT, BY SELECTED INDUSTRIES: 1909, 1904, AND 1899.

ST. LOUIS METROPOLITAN DISTRICT.

Territory included.—The St. Louis metropolitan district, which was the sixth in importance in the United States in manufacturing industries in 1909, embraces 197,993 acres of territory, of which 39,276 acres constitute the area of St. Louis and 158,717 acres the area of the outside territory. The population of the district in 1910 was 828,733 and that of the city of St. Louis proper was 687,029. As defined at the census of 1910. the metropolitan district includes, in addition to the city of St. Louis, Carondelet and Central townships, and Kirkwood city (in Bonhomme, Carondelet, and Central townships) in St. Louis County, Mo.; East St. Louis city, and Canteen, Centerville, and Stites townships in St. Clair County, Ill.; and Nameoki and Venice townships in Madison County, Ill. The part of Kirkwood city in Bonhomme township, Mo., and Nameoki and Venice townships (in which Granite City is situated) have been added to the district as it was constituted for the report for the census of 1905 on Industrial Districts, Bulletin No. 101. A part of Centerville township was annexed to Belleville city in 1906 and is now outside the district. It is impracticable to segregate statistics for manufacturing establishments, if any, within this small area in 1904 and 1899. Canteen township was organized from a part of Centerville township in 1910. Parts of Centerville township were also added to East St. Louis city in 1908 and 1909.

On page 940 is an outline map of the St. Louis district showing the cities of St. Louis, East St. Louis, and Kirkwood, and the various townships included.

Summary for the district.—Table 29 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the St. Louis metropolitan district, for the cities of St. Louis and East St. Louis, and for the remainder of the district, the percentage which the figure for St. Louis represents of the total for the district being shown in the case of each item.

1 April 15, 1910.

In the St. Louis district, as in Cleveland, Detroit, and all but two of the other districts, the greater part of the value of manufactured products of the district was reported by factories within the central city. St. Louis contained over four-fifths (82.9 per cent) of the population of the district of which it is the manufacturing, commercial, and financial center, and contributed over three-fourths (76.4 per cent) of the value of products for the district. Its manufacturing establishments constituted over nine-tenths (90.4 per cent) of all in the district, and gave employment to more

than four-fifths (82 per cent) of the average number of wage earners for that area. The principal industries of East St. Louis in 1909 were flour mills and grist mills, foundries and machine shops, steel works and rolling mills, and the chemical industry.

Granite City, which is included with the "remainder" of the district, as it was returned as of less than 10,000 population in 1910, has important manufactures, with large values of products. These manufactures include steel, glucose, babbitt metal and solder, tin plate and terneplate, and stamped and enameled ware.

ST. LOUIS METROPOLITAN DISTRICT: 1909.

Comparison with earlier censuses.-Table 30 is a comparative summary for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census. For purposes of accurate comparison with the statistics for the dis-

trict as given for 1904 and 1899, the totals for 1909 are segregated into figures for the territory added since 1904, and into those for the remainder of the district.

¹ Bureau of the Census: Industrial Districts, 1905, p. 45.

¹ A minus sign (—) denotes decrease.
2 Figures in this column used in computing percentages of increase.

The percentage of increase in salaried employees, salaries, and cost of materials was greater during the more recent five-year period, 1904-1909, than during the period 1899-1904. The number of establishments increased during the later five years, while an actual decrease was reported for the earlier period. The percentages of increase during the decade 1899-1909 were much larger in salaries and capital than for any other items. The average number of wage earners increased 41.6 per cent and their wages 76.2 per cent, a rate of gain almost as great as that in value of products-79.5 per cent. The rate of increase in primary horsepower of all kinds from 1904 to 1909 was 58.7 per cent. Statistics as to the primary power used in 1899 are not available.

The proportions of the population and manufactures in the outside territory, as compared with the total for the metropolitan district, are constantly increasing, as is indicated by the percentages in Table 31. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904.

The proportion of the population of the district as originally constituted, reported from the territory outside of St. Louis, increased from 9.9 per cent in 1900 to 14.6 per cent in 1910, and the proportion of the value of products increased steadily from 15.1 per cent in 1899 to 16.4 per cent in 1904 and 19.8 per cent in 1909.

¹ Excluding statistics for establishments located outside of the corporate limits of St. Louis, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

Among the 46 industries shown separately in the table there are 10 for which totals for the district can not be published, because to do so would disclose individual operations; and 16 which were not carried on in the part of the district which is outside the corporate limits of St. Louis. In all these cases the statistics shown are figures for St. Louis exclusively.

The most important industry in the St. Louis metropolitan district, measured by value of products, was slaughtering and meat packing, while the manufacture

of boots and shoes was second in this respect, but led in average number of wage earners and wages. The establishments in the boot and shoe industry, all of which were within the city limits, contributed over two-thirds of the value of products for this industry reported for the state. The tobacco industry, for which separate figures can not be given without disclosing the operations of individual establishments, ranked third, followed by the manufacture of malt liquors.

Comparative summary, by industries.—The number of establishments, average number of wage earners, and value of products reported for such of the industries as can be shown separately and had a value of products amounting to \$4,000,000 or more in 1909 are given in Table 33 for 1909, 1904, and 1899.

The greatest absolute increase in value of products during the decade in the area under consideration was reported for the slaughtering and meat-packing industry-\$41,186,839, or 101.2 per cent. The greatest relative increase, 383.1 per cent, is shown for the manufacture of copper, tin, and sheet-iron products, but as figures for one establishment are omitted from the total for the industry for 1899, in order to

avoid disclosing individual operations, the actual percentage of increase in this industry is less than that shown in the table. Moreover, the increase shown is due, in part, to the inclusion of a large establishment in Granite City, which was not a part of the district for 1904 and 1899. The manufacture of boots and shoes, including cut stock and findings, shows exceptional development during the decade, the average number of wage earners in the industry having increased 124.9 per cent and the value of products 300.3 per cent. The total for steel works and rolling mills is considerably increased for 1909 by the addition of statistics for establishments not included in the district as constituted for 1904.

COMPARATIVE SUMMARY FOR THE ST. LOUIS METROPOLITAN DISTRICT, BY SELECTED INDUSTRIES: 1909, 1904, AND 1899.

CLEVELAND METROPOLITAN DISTRICT: 1909.

CLEVELAND METROPOLITAN DISTRICT.

Territory included .- The metropolitan district of Cleveland embraces 103,174 acres of territory, of which 29,209 acres constitute the area of Cleveland and 73.965 acres the area of the outside territory. population of the city of Cleveland proper in 1910 was 560,663, and that of the outside territory 52,607, the total for the district being 613,270. As defined at the census of 1910, the metropolitan district includes the central city, together with Bratenahl, Brooklyn, Brooklyn Heights, Cleveland Heights, East Cleveland, Euclid, Goldwood, Middleburgh, Newburgh, Newburgh Heights, Rockport, Rocky River, and West Park townships in Cuyahoga County. The industrial district covered by the report on industrial districts for the census of 1904 (Bulletin No. 101) did not include Middleburgh township, but it comprised, in addition to the territory represented by the other places named above, the area which now constitutes Bedford, Independence, South Newburgh, and Warrensville townships. Glenville township (the part which remained after the organization of Bratenahl township in 1904), part of Brooklyn township, and part of Newburgh Heights township were added to Cleveland in 1905; Corlett township, which formed part of Newburgh township in 1904, was annexed in 1909; and part of what was Collinwood township in 1904 was annexed in 1910. Goldwood township was organized from part of Rocky River township in 1910.

The location of each of the constituent divisions of the district is indicated on the outline map (p. 944).

Summary for the district.—Table 34 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Cleveland metropolitan district, for the city of Cleveland, and for the remainder of the district, the percentage which the figure for Cleveland represents of the total for the district being shown in the case of each item.

In 1909 the Cleveland metropolitan district had 2,230 manufacturing establishments, which gave employment to an average of 103,709 persons during the year, and paid out \$66,805,430 in salaries and wages. Of the persons employed, 89,088 were wage earners. These establishments turned out products to the value of \$281,992,131, to produce which materials costing \$159,896,454 were utilized. The value added by manufacture was thus \$122,095,677. The Cleveland district ranked seventh in 1909 among the metropolitan districts of the United States in the value of its manufactured products.

The percentages which the figures relating to manufacturing industries in the central city in 1909 form of the total for the district are higher than in any other of the districts except two—Detroit, which exceeds in percentage of establishments and salaried employees, and Minneapolis-St. Paul, where the concentration is greater in 7 of the 15 items shown. They are remarkable for their small degree of variation, ranging from 92.5 per cent for primary horse-power to 97 per cent in the case of proprietors and firm members.

¹ Includes Lakewood city, coextensive with Rockport township, the statistics for which can not be shown without disclosing individual operations. ² April 15, 1910.

Comparison with earlier censuses.—Table 35 is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census. For purposes of accurate comparison the totals for 1909 have been adjusted by segregating the figures for the territory added since 1904; and those for 1904 and 1899 by segregating the figures for the territory deducted since 1904.

The percentage of increase in all items shown except capital was greater during the more recent five-year period, 1904–1909, than during the period 1899–1904. The percentage of increase during the decade 1899–1909 was considerably larger in salaries, miscellaneous expenses, and number of salaried employees than for any other items. The average number of wage earners increased only 56.4 per cent, but the wages increased 86.1 per cent, a rate of increase considerably less than that in value of products, 98.6 per cent. The relative increase in primary horsepower of all kinds from 1904 to 1909 was 36.9 per cent. Statistics as to the primary power used in 1899 are not available.

¹ Figures in this column used in computing percentages of increase.
2 April 15, 1910.

The proportions which the population and manufactures outside of the city of Cleveland represent of the totals for the metropolitan district are shown for 1909, 1904, and 1899 in Table 36. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904; and those for 1904 and 1899 upon the figures for the district exclusive of the territory deducted.

Except for population and number of establishments, for which the proportion in the outside territory decreased, there was an increase in the percentages for every item shown from census to census. However, from 1904 to 1909 some items show an increase, while others show a decrease. The proportion of the value of products contributed by the territory outside of the city of Cleveland increased steadily from 1.8 per cent in 1899 to 3.4 per cent in 1904 and 3.5 per cent in 1909.

A considerable area has been annexed to the city of Cleveland since 1904, but it is not practicable to ascertain the figures for the manufacturing establishments reported therefrom. The fact that losses or only slight gains in the relative importance of the outside territory are shown in 1909 as compared with No population census in 1905. June I, 1900.

⁵ Figures not available.

1904 for most of the items in the table is due in part to these annexations.

¹ Excluding statistics for establishments located outside of the corporate limits of Cleveland, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

The 35 industries shown separately in the table include 10 for which totals for the district can not be published, because to do so would disclose individual operations; and 18 which were not carried on in the part of the district which is outside the corporate limits of Cleveland. In all these cases the statistics shown are figures for Cleveland exclusively.

The principal industry of the Cleveland metropolitan district in 1909, measured by value of products, was steel works and rolling mills, closely followed by foundries and machine shops. The latter industry, however, ranked first in all other items except primary horsepower and cost of materials. The automobile industry, with products valued at \$21,403,926,

occupied third place. Slaughtering and meat packing, the making of women's clothing, printing and publishing, the paint and varnish industry, and the manufacture of men's clothing were among the leading industries of the district. The blast-furnace industry was also important, but it can not be shown separately without disclosing the operations of individual establishments.

Comparative summary, by industries.—The number of establishments, average number of wage earners, and value of products for such of the industries as can be shown separately and had a value of products amounting to \$4,000,000 or more in 1909 are given in Table 38 for 1909, 1904, and 1899.

1 A minus sign (—) denotes decrease.
2 Excluding statistics for one establishment, to avoid disclosure of individual operations.
3 Comparable figures not available.
4 Excluding statistics for two establishments, to avoid disclosure of individual operations.
5 Includes "printing and publishing, music;" "bookbinding and blank-book making;" "engraving steel and copper plate, including plate printing;" and "lithographing."

Comparable figures are not available for 1899 for the three most important industries in the district. The greatest absolute and relative increases during the

five-year period, 1904-1909, in average number of wage earners and value of products are shown for the manufacture of automobiles, including bodies and parts.

BUFFALO METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Buffalo embraces 132,413 acres of territory, of which 24,791 acres constitute the area of Buffalo and 107,622 acres the area of the outside territory. The population of the city of Buffalo proper in 1910 was 423,715, and that of the outside territory 64,946, the total for the district being 488,661. As defined at the census of 1910 the metropolitan district comprised the cities of Buffalo, Lackawanna, and Tonawanda, and the towns of Cheektowaga, Hamburg, Lancaster, Tonawanda, and West Seneca, all of which are in Eric County, and the city of North Tonawanda in Niagara County.

The industrial district covered by the figures published for 1904 and 1899 did not include Lancaster or North Tonawanda, but comprised, in addition to the territory represented by the other places just mentioned, the towns of Amherst and East Hamburg.

Since the census of 1904 Lackawanna has been incorporated as a city, but the figures for it can not be shown separately, as to do so would disclose the operations of an individual establishment of great importance, which is engaged in the iron and steel and certain related industries. On page 950 is an outline map of the metropolitan district as constituted in 1909, showing the various cities and towns included.

Summary for the district.—Table 39 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Buffalo metropolitan district, for the cities of Buffalo and North Tonawanda, and for the remainder of the district, the percentage which the figure for Buffalo represents of the total for the district being shown in the case of each item. The statistics for Lackawanna are included in the "remainder" of the district to avoid disclosing individual operations.

¹ Includes Lackawanna, the statistics for which can not be shown without disclosing individual operations.

In 1909 the Buffalo metropolitan district had 1,964 manufacturing establishments, which gave employment to an average of 75,086 persons during the year and paid out \$47,363,003 in salaries and wages. Of the persons employed, 63,572 were wage earners. These establishments turned out products to the value of \$279,852,346, to produce which materials costing \$180,458,300 were utilized. The value added by manufacture was thus \$99,394,046. The Buffalo district ranked eighth in 1909 among all the metropolitan districts of the United States in the value of its manufactured products.

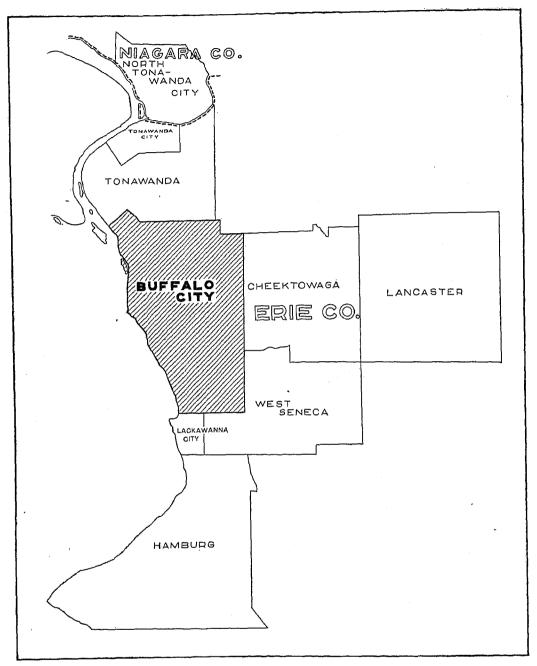

The greater part of the value of the manufactured products of the district was reported by factories within the central city. Buffalo contained nearly nine-tenths (86.7 per cent) of the population of the district of which it is the manufacturing, commercial, and financial center, and contributed nearly eight-tenths (78.2 per cent) of the value of products for the district. Its manufacturing establishments constituted 89.3 per cent of all in the district, and gave employment to 80.9 per cent of the average number of wage earners for that area.

The group of five towns and one city having less than 10,000 population, and Lackawanna city, statistics for which can not be shown separately without disclosing the operations of individual establishments, had a combined population equal to 10.8 per cent of the total for the district and contributed 18.4 per cent of the value of its products.

(949)

² April 15, 1910.

BUFFALO METROPOLITAN DISTRICT: 1909.

Comparison with earlier censuses.—Table 40 is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census. For purposes of accurate comparison the statistics for 1909 have been adjusted by segregating the figures for the territory added since 1904; and those for 1904 and 1899 by segregating the figures for the territory deducted since 1904.

The percentage of increase in the items shown, except average number of wage earners and wages, and for capital, services, miscellaneous expenses, and

1 Marian

value added by manufacture, was greater during the more recent five-year period, 1904–1909, than during the period 1899–1904. The percentages of increase during the decade 1899–1909 were especially large in salaries, capital, materials, salaried employees, and miscellaneous expenses. The average number of wage earners increased 60.6 per cent and their wages 98.9 per cent, which was a much less gain than in the value of products—137.9 per cent. The relative increase in primary horsepower of all kinds from 1904 to 1909 was 77.4 per cent. Statistics as to the primary power used in 1899 are not available.

³ April 15, 1910. ⁴ State census, June 1, 1905.

⁵ June 1, 1900. ⁶ Figures not available.

The proportions of the population and manufactures in the outside territory as compared with the total metropolitan district are in general increasing, as is indicated by the percentages in Table 41. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904, and those for 1904 and 1899 upon the figures for the district exclusive of the territory deducted.

¹ Based on figures for district as constituted in 1909, exclusive of territory added since 1904.

2 Based on figures for district as constituted in 1904, exclusive of territory deducted since 1904.

2 Figures not available.

The proportion of the population of the district that was reported from the territory outside of Buffalo increased from 7 per cent in 1900 to 9.3 per cent in 1910, and the proportion of the value of products of that district that was contributed by the outlying territory increased steadily from 6.8 per cent in 1899 to 18.8 per cent in 1909.

Leading industries.—Table 42 gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the 29 industries shown separately in the table there are 12 for which totals for the district can not be published, because to do so would disclose individual operations; and 7 which were not carried on in the part of the district which is outside the corporate limits of Buffalo. In all these cases the statistics shown are figures for Buffalo exclusively.

The most important industry as measured by value of products was the manufacture of iron and steel, which is included under "all other industries," to avoid disclosure of individual operations. Of the industries shown separately, slaughtering and meat packing ranked highest in value of products, with 9.1 per cent of the total reported for all industries in the district, closely followed by foundries and machine shops, with 8.4 per cent of this total, and flour mills and gristmills, with 7.3 per cent. Other important industries, arranged according to value of products, were the manufacture of automobiles, including bodies and parts, the lumber and soap industries, printing and publishing, and the malt and malt-liquor industries.

The greatest absolute increase in value of products during the decade in the area under consideration, \$17,007,721, or 507.6 per cent, is shown for flour mills and gristmills, and the next greatest relative increase is in copper, tin, and sheet-iron products.

Of the industries shown in the comparative table, only two-lumber and timber products and foundry and machine-shop products—are greatly affected by the inclusion of statistics for manufactures in territory added to the district since 1904.

¹ A minus sign (—) denotes decrease. Percentage not shown where base is less than 100 for wage earners, or less than \$100,000 for value of products.

2 Excluding statistics for one establishment, to avoid disclosure of individual operations.

3 Excluding statistics for two establishments, to avoid disclosure of individual operations.

4 Comparable figures not available.

5 Includes "bookbinding and blank-book making;" "engraving, steel and copper plate, including plate printing;" and "lithographing;" and for 1909 and 1904 "printing and publishing, music."

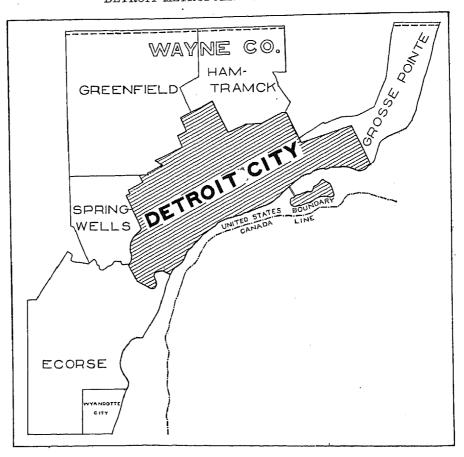

DETROIT METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Detroit embraces 96,554 acres, of which 26,103 acres comprise the area of Detroit and 70,451 acres the area of the outside territory. The population of the city of Detroit proper in 1910 was 465,766 and that of the outlying territory 35,216, the total for the district being 500,982. In addition to the city of Detroit the district includes Wyandotte city and the townships of Ecorse, Greenfield, Grosse Pointe, Hamtramck, and Springwells, all of which are in Wayne County. Owing to the fact that adjacent territory in Canada, including the thriving municipalities of Windsor and Walkerville, is industrially to a large extent tributary to

Detroit, the statistics for the district do not adequately represent the area closely associated with the development of Detroit. A tendency on the part of the city to enlarge its area in conformity with the metropolitan development seems to be indicated by its recent acquisitions of territory, namely, part of Greenfield township (288 acres) added in 1905; part of Springwells township (4,416 acres), including Delray village, added in 1906; and parts of Grosse Pointe, Greenfield, and Hamtramck townships (3,255 acres) added in 1907.

The following is an outline map of the district showing the various cities and townships included:

DETROIT METROPOLITAN DISTRICT: 1909.

Detroit was first settled in 1701 by the French, in whose possession it remained until surrendered to the British in 1760. In 1796 it became territory of the United States. It was incorporated as a town in 1802 and as a city in 1815. Detroit was the seat of government of Michigan territory until 1837, when the territory

became a state, and was capital of the state until 1847. The progress of the city commercially, industrially, and in other respects, particularly during the decade 1899–1909, has been very marked. While Detroit has many industrial advantages, perhaps the most important is its geographical position with reference

to the Great Lakes, the city being situated on the Detroit River, the channel of communication between the upper and lower lakes.

Summary for the district.—Table 44 is a summary of the statistics of manufacturing industries in 1909, with a statement of the population in 1910, for the Detroit metropolitan district, for the city of Detroit, and for the territory outside Detroit, the percentage which the figure for Detroit represents of the total for the district being shown in the case of each item.

The percentages which the figures for the central city represent of the total for the metropolitan district are much larger than in the case of most of the other metropolitan districts discussed in this report. It should be borne in mind in this connection that certain Canadian municipalities are closely associated with the city commercially and industrially. The percentages representing the contribution of Detroit to the totals for the district are remarkable for their small degree of variation, being over 90 in the case of every item except primary horsepower, for which the figure is 83.7.

¹ Excluding statistics for establishments located outside of the corporate limits of Detroit, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

Among the 31 industries shown separately in the table are 9 for which the totals for the district can not be published, because to do so would disclose individual operations; and 17 which were not carried on in the part of the district which is outside the corporate limits of Detroit. In all these cases the statistics shown are figures for Detroit exclusively.

By far the most important industry in Detroit is the manufacture of automobiles, including bodies and parts. The figures given for this industry in the table do not include statistics for one establishment located outside the city limits. The 68 establishments engaged in this industry in Detroit reported 22.1 per cent of the value of products for all industries in the metropolitan district. Aside from the omission of the establishment located outside the limits of Detroit, the statistics given for the industry do not adequately represent the importance of the industry in the district, owing to the fact that many establishments engaged in the manufacture of brass and bronze products and foundry and machine-shop products, which are also leading industries in the district, turn out automobile accessories and manufacture and repair automobile engines and parts.

Other important industries, arranged according to the value of products, were slaughtering and meat packing, the manufacture of tobacco products and of patent medicines and compounds, printing and publishing, and the lumber industry. The manufacture of chemicals, an industry for which separate statistics can not be published without disclosing individual operations, is also of considerable importance.

CINCINNATI METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Cincinnati embraces 111,772 acres of territory, of which 31,893 acres constitute the area of Cincinnati and 79,878 acres the area of the outside territory. The population of the city of Cincinnati proper in 1910 was 363,591, and that of the outside territory, 200,213, the total for the district being 563,804.

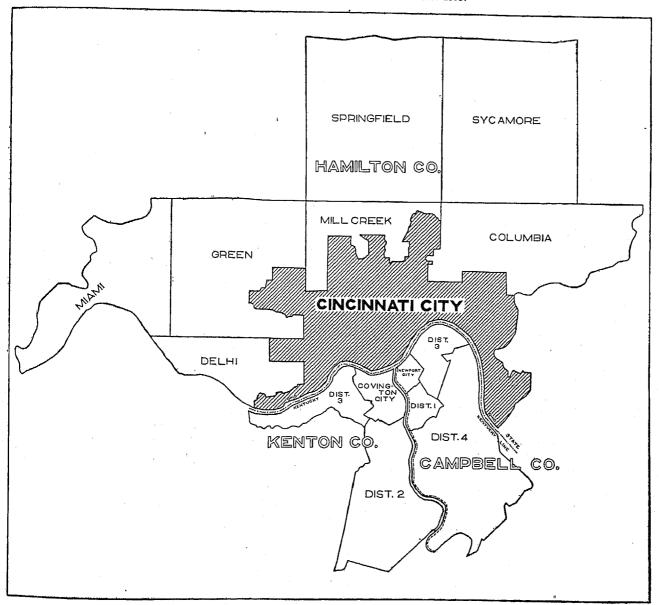

As defined at the census of 1910, the metropolitan district comprised, in addition to the central city, seven townships in Hamilton County, Ohio—Columbia, Delhi, Green, Miami, Millcreek, Springfield, and Sycamore—and seven magisterial districts in Kentucky—the first, second, third, and fourth in Campbell County, and the first, second, and third in Kenton County.

The incorporated places of over 10,000 inhabitants within the district, besides Cincinnati, are Norwood city, Ohio, which is included in Columbia and Millcreek townships; Newport city, Ky., which comprises district 2 and part of district 1 in Campbell County; and Covington city, Ky., which comprises district 1 and part of districts 2 and 3 of Kenton County.

The report for 1904 included all the cities named and all the townships except Miami, Springfield, and Sycamore. In 1907 a part of Millcreek township was annexed to Cincinnati, and in 1909 Spencer and parts of Anderson and Delhi townships were added to the city.

The following is an outline map of the metropolitan district as constituted in 1909, showing the various cities, townships, and magisterial districts included:

CINCINNATI METROPOLITAN DISTRICT: 1909.

Summary for the district.—Table 46 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Cincinnati metropolitan district; for Cincinnati and Norwood cities in Ohio, and Covington and Newport

cities in Kentucky, and for the territory outside these cities which is included in the metropolitan district. The percentage which the figure for Cincinnati represents of the total for the district is shown in the case of each item.

¹ April-15, 1910.

In 1909 the Cincinnati metropolitan district had 2,827 manufacturing establishments, which gave employment to an average of 95,571 persons during the year, and paid out \$57,337,552 in salaries and wages. Of the persons employed, 80,332 were wage earners. These establishments turned out products to the value of \$260,399,619, to produce which materials costing \$139,107,061 were utilized. The value added by manufacture was thus \$121,292,558. The Cincinnati district ranked tenth in 1909 among the metropolitan districts of the United States in the value of its manufactured products.

In the Cincinnati district, as in all the districts except Pittsburgh and Boston, the greater part of the value of the manufactured products of the district was reported by factories within the central city. Cincinnati contained nearly two-thirds (64.5 per cent) of the population of the district of which it is the manufacturing, commercial, and financial center, and contributed about three-fourths (74.7 per cent) of the value of products. Its manufacturing establishments constituted nearly eight-tenths (77.3 per cent) of all in the district and gave employment to approximately three-fourths of the wage earners (74.9 per cent).

Of the places outside Cincinnati for which statistics are given separately Norwood had the largest value of products, representing 3.7 per cent of the total for the metropolitan district; and it contained 5.4 per cent of the total population. The average value of manufactured products per establishment for this city was larger than for any other city shown, not excepting Cincinnati.

The group of seven townships or parts of townships, and of five magisterial districts or parts of districts, outside of incorporated places having a population of more than 10,000 had a combined population equal to 17.8 per cent of the total for the district, and contributed 15.7 per cent of the value of its products.

The principal industries of Cincinnati in 1909, as measured by value of products, were slaughtering and meat packing, foundries and machine shops, and the manufacture of men's clothing. Those of Norwood were printing and publishing, and the manufacture of paper goods (playing cards and games), furniture, and foundry and machine-shop products. During the decade this city increased in population from 6,480 to 16,185. The leading industries in Covington were foundries and machine shops and the manufacture of chewing and smoking tobacco; and in Newport, steel works and rolling mills and breweries. The most important places from a manufacturing standpoint outside of these cities were Ivorydale, with its large soap works; Lockland village, with the manufacture of roofing materials and mattresses and spring beds; and St. Bernard, with the manufacture of soap.

Comparison with earlier censuses.—Table 47 is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census. For the purposes of comparison with the statistics for the district as given for 1904 and 1899, the totals for 1909 are segregated into figures for the territory added since 1904, and into those for the remainder of the district.

A minus sign (—) denotes decrease.
 Figures in this column used in computing percentages of increase.

In all items shown, except number of establishments and cost of materials, the percentage of increase was greater during the earlier five-year period, 1899-1904, than during the period 1904-1909. During the decade as a whole the rate of increase was much greater in number of salaried employees and salaries than for any other items. The average number of wage earners increased only 20.3 per cent during this period, but the wages increased 49.1 per cent, a rate of gain approximately equal to that in value of products (52.9 per cent). The increase in primary horsepower of all kinds from 1904 to 1909 was 42.5 per cent. Statistics as to the primary power used in 1899 are not available.

The proportion of population and manufactures in the outside territory of the district as compared with the total for the city of Cincinnati is, in general, increasing, as indicated by the percentages in Table 48. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904.

Table 48	PER CENT OF CINCI FOR DIST		OUTSIDE OF TOTAL

No population census in 1905.

⁵ June 1, 1900. ⁶ Figures not available.

territory outside of Cincinnati, increased from 31.1 per cent in 1900 to 32 per cent in 1910, and the proportion of the value of products of that district that was contributed by the outlying territory increased steadily from 13.7 per cent in 1899 to 18.2 per cent in 1904 and 22.5 per cent in 1909.

Leading industries.—Table 49 gives the statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the 45 industries shown separately in the table there are 14 for which totals for the district can not be published, because to do so would disclose the operations of individual establishments, and 8 which were not carried on in the part of the district which is outside the corporate limits of Cincinnati. In all these cases the statistics shown are figures for Cincinnati exclusively.

The manufacture of soap is a very prominent industry in the district, but it is not shown separately because only the comparatively small part of it reported from the city of Cincinnati can be given without disclosure of the operations of individual establishments.

The manufacture of foundry and machine-shop products was the leading industry in the Cincinnati district, the value of the products amounting to 10.1 per cent of the value of the products for all industries. There were two other industries having also a considerable proportion of the total-slaughtering and meat packing, with 7.7 per cent, and men's clothing, including shirts, with 6.8 per cent. Printing and publishing and the manufacture of malt liquors, carriages and wagons and materials, and lumber and timber products were also prominent.

Important industries for which complete figures can not be given without disclosing the operations of individual concerns are, in the order of their importance, liquors, distilled, and electrical machinery, apparatus, and supplies.

Comparative summary, by industries.—The number of establishments, average number of wage earners, and value of products for such of the industries as can be

shown separately and had a value of products amounting to \$2,000,000 or more in 1909 are given in Table 50 for 1909, 1904, and 1899.

COMPARATIVE SUMMARY FOR THE CINCINNATI METROPOLITAN DISTRICT, BY SELECTED INDUSTRIES: 1909, 1904, AND 1899.

1 A minus sign (—) denotes decrease. Percentages not shown where base is less than 100 for wage earners.
2 Comparable figures not available.
3 Excluding statistics for two establishments, to avoid disclosure of individual operations.
4 Excluding statistics for one establishment, to avoid disclosure of individual operations.
5 Includes" bookbinding and blank-book making;" "engraving, steel and copper plate including plate printing;" and "lithographing."
6 Excluding statistics for three establishments, to avoid disclosure of individual operations.

The greatest absolute increase in value of products during the decade shown for any industry in the table is for slaughtering and meat packing-\$9,139,372, or 84.8 per cent. The greatest relative increase, 147.9 per cent, was reported for the manufacture of copper, tin, and sheet-iron products.

93426°---13-----61

Among important industries that can not be shown at all in any tables without disclosing the operations of individual establishments are, in the order of their importance, the manufacture of roofing materials, mattresses and spring beds, paper goods, and cottonseed oil and cake.

MANUFACTURES.

No.

BALTIMORE METROPOLITAN DISTRICT: 1909.

BALTIMORE METROPOLITAN DISTRICT.

Territory included.—The metropolitan district of Baltimore embraces 184,660 acres of territory, of which 19,290 acres constitute the area of Baltimore, and 165,370 acres the area of the outside territory. The population of the city of Baltimore proper in 1910 was 558,485, and that of the outside territory 100,230, the total for the district being 658,715.

As defined at the census of 1910, the metropolitan district comprised, in addition to the city of Baltimore, eight election districts, namely, Districts 1, 3, 9, 12, 13, 14, and 15, in Baltimore County, and District 5 in Anne Arundel County. The report for 1904 included all this territory but District 5.

On page 962 is an outline map of the metropolitan district as constituted in 1909, showing Baltimore and the election districts included.

Summary for the district.—Table 51 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910 for the Baltimore metropolitan district, for the city of Baltimore, and for the remainder of the district; the percentage which the figure for Baltimore represents of the total for the district being shown for each item.

¹ April 15, 1910.

In 1909 the Baltimore metropolitan district had 2,668 manufacturing establishments, which gave employment to an average of 94,954 persons during the year, and paid out \$48,585,334 in salaries and wages. Of the persons employed 81,825 were wage earners. These establishments turned out products to the value of \$260,213,324, to produce which materials costing \$165,085,541 were utilized. The value added by manufacture was thus \$95,127,783. The Baltimore

district ranked eleventh in 1909 among all the metropolitan districts of the United States in the value of its manufactured products.

In the Baltimore district, as in most of the other districts, the greater part of the value of the manufactured products of the district was reported by factories within the central city. Baltimore contained more than four-fifths (84.8 per cent) of the population of the district of which it is the manufacturing, commercial, and financial center, and contributed a little more than seven-tenths (71.9 per cent) of the value of products for the district. Its manufacturing establishments constituted over nine-tenths (93.8 per cent) of all in the district, and gave employment to nearly nine-tenths (87.3 per cent) of the wage earners.

As there are no incorporated places in any of the election districts, separate figures are not given for any places except Baltimore, although Sparrow Point and Canton are of much industrial importance. For the steel works, blast furnaces, steel shipbuilding plant, and coke ovens at Sparrow Point a combined value of products was reported for 1909 reaching into the millions. A large value of products was also reported for a copper smelter and refinery and for a petroleum refinery at Canton. None of these industries can be reported separately, as to do so would disclose the operations of individual establishments.

Comparison with earlier censuses.—Table 52 is a comparative summary of the statistics for the district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census. For purposes of accurate comparison the statistics have been adjusted by segregating the figures of the territory added since 1904.

The percentages of increase in all items, except capital and miscellaneous expenses, were greater for the later five-year period, 1904–1909, than during the period 1899–1904. The percentages of increase during the decade 1899–1909 were especially large in salaries, salaried employees, and miscellaneous expenses. The average number of wage earners increased 12.4 per cent and their wages 38.9 per cent, a rate of gain not equal to that in value of products—45.4 per cent. The rate of increase in primary horsepower from 1904 to 1909 was 16.1 per cent. Statistics as to the primary power used in 1899 are not available.

Based on figures for district as constituted in 1904 and 1899.
 No population census in 1905.
 Figures not available.

The proportion of the population of the district reported from the territory outside of Baltimore increased from 10.5 per cent in 1900 to 14.2 per cent in 1910, while the proportion of the value of products increased from 23.6 per cent in 1899 to 25.2 per cent in 1904 and to 27.3 per cent in 1909.

April 15, 1910.
No population census in 1905.

Leading industries.—Table 54 gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the 30 industries shown separately in the table there are 6 for which totals for the district can not be published, because to do so would disclose individual operations; and 9 which were not carried on in the part of the district which is outside the corporate limits of Baltimore. In all these cases the statistics shown are figures for the city of Baltimore exclusively.

As shown in the table, the manufacture of men's clothing is the leading industry in the Baltimore district and is wholly within the city of Baltimore, the value of the products amounting in 1909 to 13.9 percent of the value of products for all industries. Another leading industry is the smelting and refining of copper. but it can not be presented without disclosure of individual operations.

Two industries—copper, tin, and sheet-iron products and slaughtering and meat packing-have substantially the same proportion of the district's value of products-5.5 and 5.2 per cent, respectively. Other industries of nearly as great importance are the manufacture of foundry and machine-shop products and of tobacco products.

¹ A minus sign (—) denotes decrease. ² Figures in this column used in computing percentages of increase.

⁵ June 1, 1900. ⁶ Figures not available.

LA minus sign (—) denotes decrease.

Excluding statistics for one establishment, to avoid disclosure of individual operations.

Comparable figures not available.

Lincludes "printing and publishing, music;" "bookbinding and blank-book making;" "engraving, steel and copper plate, and plate printing;" and "lithographing." Excluding statistics for two establishments, to avoid disclosure of individual operations.

The greatest absolute increase in value of products during the decade, \$15,426,474, or 74 per cent, is shown for the manufacture of men's clothing. The greatest relative increase, 196.5 per cent, was reported for the manufacture of distilled liquors.

The inclusion of the 1909 statistics for establishments within the territory added to the district since 1904 affects considerably the totals for the fertilizer and canning and preserving industries, and to a much smaller degree those for lumber and timber products.

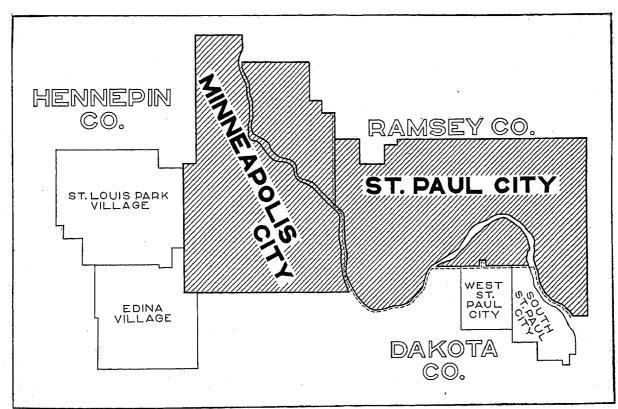

MINNEAPOLIS-ST. PAUL METROPOLITAN DISTRICT.

Territory included.—The Minneapolis-St. Paul metropolitan district embraces 94,539 acres, of which 32,069 acres represent the area of Minneapolis, 33,390 acres the area of St. Paul, and 29,080 acres the area of the outside territory. The population of Minneapolis in 1910 was 301,408, that of St. Paul 214,744, and that of the outside territory 10,104, the total for the district being 526,256. As defined at the census of 1910 the Minneapolis-St. Paul metropolitan district comprises, in addition to the cities of Minneapolis and St. Paul, the villages of Edina and St. Louis Park in Hennepin County and the cities of South St. Paul and West St. Paul in Dakota County. The territory

comprised within the Minneapolis-St. Paul industrial district as constituted for the bulletin on industrial districts for 1904 did not include South St. Paul and West St. Paul cities, but it contained in addition to the other places named above, Brooklyn, Crystal Lake, Richfield (now Richfield village), and St. Anthony townships and Robbinsdale and West Minneapolis villages in Hennepin County and New Canada and Rose townships and North St. Paul village in Ramsey County.

The location of each of the places included in 1909 is indicated on the following outline map of the district:

MINNEAPOLIS-ST. PAUL METROPOLITAN DISTRICT: 1909.

Summary for the district.—Table 56 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the Metropolitan-St. Paul district, for the cities of Minneapolis and St. Paul, and for the remainder of the district; the percentages which the figures for Minneapolis and St. Paul separately represent of the total for the district being shown in the case of each item.

In 1909 the Minneapolis-St. Paul metropolitan district had 1.844 manufacturing establishments, which

gave employment to an average of 59,920 persons during the year and paid out \$38,596,508 in salaries and wages. Of the persons employed, 48,268 were wage earners. These establishments turned out products to the value of \$244,339,598, to produce which materials were used costing \$166,823,348. The value added by manufacture was thus \$77,516,250. The Minneapolis-St. Paul district ranked twelfth in 1909 among the metropolitan districts of the United States in the value of its manufactured products.

1 April 15, 1910.

The percentages which the combined statistics for the central cities represent of the total for the metropolitan district are larger in the majority of instances than those for any of the other metropolitan districts, although those for Cleveland and Detroit are larger in a number of items. The percentage is not less than 90 for any item, the range being from 90.1 per cent for cost of materials to 99.3 per cent for proprietors and firm members. The two cities contained 98.1 per cent of the population of the district and contributed over nine-tenths (91.8 per cent) of the value of the manufactured products of the district.

Comparison with earlier censuses.—Table 57 gives statistics for the district for 1909, 1904, and 1899. For purposes of comparison the statistics in this table are grouped in such a way as to show separately for 1909 figures for (1) the territory added to the district since 1904 (South St. Paul and West St. Paul) and (2) the remainder of the district; and for 1904 and 1899 figures for (1) the territory deducted since 1904 (Brooklyn, Crystal Lake, Richfield, and St. Anthony townships, together with Robbinsdale and West Minneapolis villages, in Hennepin County and New Canada and Rose townships and North St. Paul village in Ramsey County) and (2) the remainder of the district. Percentages of increase are shown for the territory included in the metropolitan district in both 1909 and 1904.

¹ Figures in this column used in computing percentages of increase. ² April 15, 1910.

The relative increase in all the items for which comparative figures are given in the table, except miscellaneous expenses, was larger during the more recent five-year period, 1904-1909, than during the period 1899-1904. For the decade as a whole the relative increase was much greater in miscellaneous expenses, number of salaried employees, and salaries than for any other items. The average number of wage earners increased 42.4 per cent during this period, but the amount paid for wages increased 80.9 per cent, a rate of gain approximately equal to that in value of products, 80.6 per cent. The relative increase from 1904 to 1909 in the amount of primary power of all kinds used was 30.7 per cent. Statistics as to the amount of primary power used in 1899 are not available.

State census, June 1, 1905.
 June 1, 1900.

⁵ Figures not available.

The proportions which the population and statistics of manufacturing industries of the territory outside Minneapolis and St. Paul represented of the total for the area comprised in the district in both 1909 and 1904 are shown in Table 58. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904 and those for 1904 and 1899 upon the figures for the district exclusive of the territory subsequently deducted.

The proportion which the population of the territory outside of Minneapolis and St. Paul, but within the area comprised in the district, represented of the total for that area was the same for 1899 and 1909, while the proportion of the value of manufactured products of that area which was reported from such outlying territory decreased from five-tenths of 1 per cent in 1899 to four-tenths of 1 per cent in 1904 but increased to seven-tenths of 1 per cent in 1909. The percentages for all but one of the other items also decreased from 1899 to 1904, but increased from 1904 to 1909. The decade shows a steady increase.

¹ Excluding statistics for establishments located outside of the corporate limits of Minneapolis and St. Paul, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

2 Excluding statistics for establishments located outside of the corporate limits of Minneapolis, to avoid disclosure of individual operations. The figures for these establishments are included under the head of "All other industries."

Among the 27 industries shown separately in the table are 8 for which the totals for the district can not be published because to do so would disclose individual operations. Of the remaining industries only two were carried on in the part of the district which is outside the corporate limits of Minneapolis and St. Paul.

since 1904.
⁸ Figures not available.

The principal industry of the Minneapolis-St. Paul metropolitan district is the manufacture of flour-mill products; the industry, however, with the exception of two establishments in St. Paul, was confined to Minneapolis in 1909.

The value of products reported by the flour mills of Minneapolis alone was \$78,669,808, as shown in the table, and constituted 56.5 per cent of the total for the industry in the state, and 32.2 per cent of the value of all products for the district.

Other important industries, arranged according to the value of products in 1909, were slaughtering and meat packing, the lumber industry, foundries and machine shops, printing and publishing, steam-railroad repair shops, and breweries. The manufacture of linseed oil and that of bags, other than paper bags, industries for which separate statistics can not be published without disclosing individual operations, were also of considerable importance.

Comparative summary, by industries.—The number of establishments, average number of wage earners, and value of products for such of the industries as can be shown separately and had a value of products amounting to \$2,000,000 or more in 1909, are given in Table 60 for 1909, 1904, and 1899.

The greatest absolute increase in value of products during the decade is shown for the flour-mills and gristmills, amounting to \$29,000,190, or 58.4 per cent: comparisons for this industry, however, are affected to some extent by the omission of establishments from the figures for the different censuses in order to avoid disclosing the operations of individual concerns. The statistics for slaughtering and meat packing are incomparable because of the fact that in the territory added to the district subsequent to 1904 the operations in this industry were of large magnitude and the figures for this added area in 1904 and 1899 are not included in the table. Omitting this industry from consideration, the greatest relative gain in value of products during the decade was for food preparations, 491.1 per cent, followed by butter, cheese, and condensed milk, with 283 per cent.

COMPARATIVE SUMMARY FOR THE MINNEAPOLIS-ST. PAUL METROPOLITAN DISTRICT, BY SELECTED INDUSTRIES. 1909, 1904, AND 1899.

SAN FRANCISCO-OAKLAND METROPOLITAN DISTRICT.

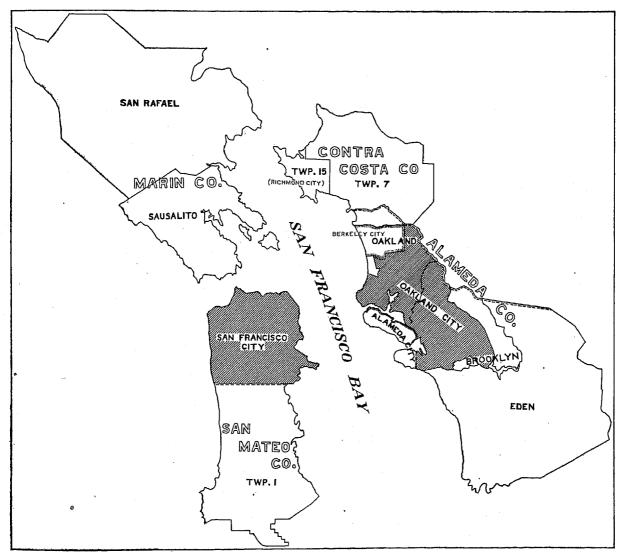

Territory included .- The San Francisco-Oakland metropolitan district embraces 289,381 acres of territory, of which 29,760 acres constitute the area of San Francisco, 29,248 acres the area of Oakland, and 230,373 acres the area of the outside territory. The population of the city of San Francisco in 1910 was 416.912, that of the city of Oakland 150,174, and that of the outside territory 119,787, the total for the district being 686,873.

As defined at the census of 1910, the metropolitan district comprised, in addition to the cities of San Francisco and Oakland, Alameda and Berkeley, with that part of Brooklyn township not included in Oakland city, and that part of Oakland township not included in Oakland and Berkeley; Eden township in Alameda County; townships 7 and 15 in Contra Costa County; San Rafael and Sausalito townships in Marin County; and township 1 in San Mateo County. The industrial district as constituted for the bulletin on industrial districts for 1904 and 1899 did not embrace Eden township in Alameda County or the townships in Contra Costa County and Marin County, but, in addition to the places mentioned, included part of township 2 of San Mateo County, including San Mateo city.

The following is an outline map of the metropolitan

district as constituted in 1909:

SAN FRANCISCO-OAKLAND METROPOLITAN DISTRICT: 1909.

Summary for the district.—Table 61 is a summary for 1909 of the statistics of manufacturing industries, with a statement of the population in 1910, for the San Francisco-Oakland district; for the cities of San Francisco, Oakland, Alameda, and Berkeley; and for the remainder of the district. The percentages which the figures for San Francisco and Oakland separately represent of the total for the district are shown in the case of each item.

In 1909 the San Francisco-Oakland metropolitan district had 2,539 manufacturing establishments, which gave employment to an average of 53,177 persons during the year and paid out \$43,298,791 in salaries and wages. Of the persons employed, 41,615

were wage earners. These establishments turned out products to the value of \$199,593,117, to produce which materials costing \$117,440,976 were utilized. The value added by manufacture was thus \$82,152,141. The San Francisco-Oakland district ranked thirteenth in 1909 among the metropolitan districts discussed in this report in the value of its manufactured products.

¹ April 15, 1910.

The greater part of the value of the manufactured products of the district was reported by factories within the central cities. San Francisco and Oakland combined contained over four-fifths (82.6 per cent) of the population of the district of which they are the manufacturing, commercial, and financial center, and contributed nearly eight-tenths (77.9 per cent) of the value of products. Their manufacturing establishments constituted 88.1 per cent of all in the district and gave employment to 84.5 per cent of the average number of wage earners for that area.

Of the two cities outside of San Francisco and Oakland for which statistics are given separately, Berkeley had the larger value of products, representing 2.2 per cent of the total for the metropolitan district. The population of Berkeley formed 5.9 per cent of the total for the district.

The average value of products per establishment was larger for San Francisco than for any other city of the district.

The group of eight townships or parts of townships not shown separately, with a combined population equal to 8.1 per cent of the total for the district, contributed 18.6 per cent of the value of the products.

The principal industries of San Francisco in 1909, as measured by value of products, were the refining of sugar, printing and publishing, slaughtering and meat packing, and foundries and machine shops; of Oakland, the lumber industry, and foundries and machine shops;

of Alameda, shipbuilding; and of Berkeley, foundries and machine shops.

Comparison with earlier censuses.—Table 62 is a comparative summary for the statistics for the San Francisco-Oakland district as a whole for 1909, 1904, and 1899, together with the percentages of increase from census to census.

For purposes of accurate comparison the statistics for 1909 have been adjusted by segregating the figures for the territory added since 1904; and those for 1904 by segregating the figures for the territory deducted since 1904. The figures for 1899, however, as published in the report for 1904, are not affected except as to population, no manufactures being reported for 1899 from the deducted territory.

The percentage of increase in all items shown, except capital and cost of materials, was greater during the earlier five-year period, 1899–1904, than during the period 1904–1909. The percentages of increase during the decade, 1899–1909, were much larger in salaries, miscellaneous expenses, capital, and number of salaried employees than in any other items. The average number of wage earners increased only 9.8 per cent during this period, but the amount paid for wages increased 62.9 per cent, a rate of gain approximately equal to that in value of products—65.9 per cent. The rate of increase in primary horsepower of all kinds from 1904 to 1909 was 50.5 per cent. Statistics as to the power used in 1899 are not available.

1 A minus sign (—) denotes decrease.
2 Figures in this column used in computing percentages of increase.
8 April 15, 1910.
4 No population census in 1905.
6 June 1, 1900. Excluding Township 2 of San Mateo County, not a part of the district in 1909; no manufactures were reported from this township.
6 Figures not available.

The proportions which the population and the statistics of manufacturing industries in the territory outside the central cities, but within the area comprised in the district, represent of the total for that area are shown in Table 63. The percentages for 1909 are based upon the figures for the district exclusive of the territory added since 1904, and those for 1904 and 1899 upon the figures for the district exclusive of the territory subsequently deducted.

¹Based on figures for district as constituted in 1909, exclusive of territory added

The proportion of the population of the district as originally constituted that was reported for the territory outside of San Francisco and Oakland increased from 9.1 per cent in 1900 to 12.2 per cent in 1910, and the proportion of the value of products of the district that was contributed by the outlying territory increased steadily from 5.7 per cent in 1899 to 7.6 per cent in 1904, and 21.4 per cent in 1909. The great increase of the manufacturing activities in the outside area shown for the period 1904-1909 was due in part to the earthquake and fire in San Francisco in 1906.

Leading industries.—Table 64 gives statistics for 1909 for the industries of the district having products valued at \$500,000 or more, so far as separate figures can be presented.

Among the 38 industries shown separately in the table there are 6 for which totals for the district can not be published, because to do so would disclose individual operations; the statistics shown are for San Francisco exclusively. Four industries were not carried on in the part of the district outside the corporate limits of San Francisco-Oakland.

Of the industries shown separately, slaughtering and meat packing ranked highest in value of products, with 10.1 per cent of the total reported for all industries in the district, followed by printing and publishing with 7.1 per cent, and foundries and machine shops with 6.4 per cent. Three industries—canning and preserving and the lumber and bakery industrieseach contributed 3.8 per cent of the total value of manufactured products for the district.

since 1904.

*Based on figures for district as constituted in 1904, exclusive of territory deducted since 1904.

*No population consus in 1905.

1 A minus sign (—) denotes decrease.
2 Excluding statistics for two establishments, to avoid disclosure of individual operations.
3 Includes "printing and publishing, music;" "bookbinding and blank-book making;" "engraving, steel and copper plate, including plate printing;" and "lithographing."
4 Comparable figures not available.
5 Excluding statistics for one establishment, to avoid disclosure of individual operations.

The greatest absolute increase in value of products during the decade in the area under consideration, \$11,433,281, or 130.4 per cent, is shown for slaughtering and meat packing. The greatest relative increase shown for any of the industries included in the tables was reported for the manufacture of paint and varnish-558.5 per cent. Among the important industries that can not be shown separately, as to do so would disclose the operations of individual establishments, are the refining of sugar and of petroleum and the manufacture of explosives and of paper bags.

THE MANUFACTURE OF TEXTILES

INTRODUCTION.

This bulletin contains special reports for the textile industry as a whole and for its several branches for the calendar year 1909. It embraces the following industries: Cotton manufactures; hosiery and knit goods; woolen, worsted, and felt goods, and wool hats; carpets and rugs; shoddy; wool pulling; wool scouring; fur-felt hats; silk manufactures; cordage and twine and jute and linen goods; and the dyeing and finishing of textiles. These special reports have been printed as a part of Volume X of the final reports of the Thirteenth Census.

The general results of the census inquiry are summarized in certain tables presented in connection with the text, while other tables give statistics in detail by states. Special tables are also presented in which the statistics for the establishments engaged in the several industries are classified according to character of ownership, value of products, number of wage earners, and prevailing hours of labor, while still another set of tables gives detailed information in regard to the quantity and cost of materials, the quantity and value of the products, the principal kinds of equipment used, and imports and exports.

Scope of census.—Census statistics of manufactures are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of establishments, and similar subjects. When use is made of the data for these purposes it is imperative that due attention should be given to the limitations of the figures, particularly in any attempt to derive from them figures purporting to show average wages, cost of production, or profits. These limitations are fully discussed in the general report on manufactures for the United States as a whole (Volume VIII of Thirteenth Census Reports) and need not be repeated here.

The census did not cover establishments which were idle during the entire year or had a value of products of less than \$500, nor the manufacturing done in educational, eleemosynary, and penal institutions.

Period covered.—The returns relate to the calendar year 1909, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the year.

The establishment.—As a rule, the term "establishment" represents a single plant or mill, but in some cases it represents two or more plants which were operated under a common ownership or for which one set of books of account was kept.

If, however, the plants constituting an establishment as thus defined were not all located within the same city or state, separate reports were secured in order that the figures for each plant might be included in the statistics for the city or state in which it was located. In some instances separate reports were secured for different industries carried on in the same establishment.

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1909 with the corresponding figures for earlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in the industry.—At the censuses of 1899, 1904, and 1909 the ollowing general classes of persons engaged in manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clerks (including other subordinate salaried employees), and (5) wage earners. In the reports for the censuses of 1904 and 1899 these five classes were shown according to the three main groups: (1) Proprietors and firm members, (2) salaried officials, clerks, etc., and (3) wage earners. The second group included the three classes of salaried officers of corporations, superintendents and managers, and clerks. In certain tables relating exclusively to the present census a somewhat different grouping is employed—that into (1) proprietors and officials, (2) clerks, and (3) wage earners, the first group including proprietors and firm members, salaried officers of corporations, and superintendents and managers. In comparative tables covering the censuses of 1899 and 1904 it is of course necessary to group the figures for 1909 according to the classification that was employed at the earlier censuses.

At this census the number of persons engaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. For most industries the 15th of December was selected as representing normal conditions of employment, but where conditions were exceptional and the December date could not be accepted as typical an earlier date had to be chosen.

In the case of employees other than wage earners the number thus reported on December 15, or other representative day, has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average is obtained in the manner explained in the next paragraph.

In addition to the more detailed report by sex and age of the number of wage earners on December 15, or other representative day, a report was obtained of the number employed on the 15th of each month, without distinction of sex or age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The average thus obtained represents the number of wage earners that would be required to perform the work done if all were constantly employed during the entire year. Accordingly, the importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day.

In 1899 and 1904 the schedule called for the average number of wage earners of each sex 16 years of age and over, and the average number under 16 years of age without distinction of sex, for each month, and these monthly statements were combined in an annual average. Comparatively few manufacturing concerns, however, keep their books in such way as to show readily the number of men, women, and children employed on the average each month. These monthly returns by sex and age were, in fact, largely estimates.

It was believed that a more accurate and reliable sex and age distribution could be secured by taking as a basis of estimate the actual numbers employed on a single day. In 1889 the time the plant was in operation was used as a basis for computing the average number of employees, whether such time was the entire year or only a fraction of a year. These differences in method have but little effect upon the comparability of the statistics, however, except for certain seasonal industries like canning and preserving.

Prevailing hours of labor.—The census made no attempt to ascertain the number of employees working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each establishment. Occasional variations in hours in an establishment from one part of the year to another were disregarded, and no attention was paid to the fact that a limited number of employees might have hours differing from those of the majority. In the tables all the wage earners of each establishment are counted in the class within which the establishment itself falls. In most establishments, however, all or practically all the employees work the same number of hours, so that these figures give a substantially correct representation of the hours of labor.

Capital.—For reasons stated in the general report on manufactures for the United States as a whole (Volume VIII of Thirteenth Census Reports), the statistics of capital secured by the census canvass are so defective as to be of little value, except as indicating very general conditions. The instructions on the schedule for securing data relating to capital were as follows:

The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If land or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises.

Materials.—The statistics as to cost of materials relate to the materials used during the year, which may be more or less than the

materials purchased during the year. The term "materials" includes fuel, rent of power and heat, mill supplies, and containers, as well as materials forming a constituent part of the product.

Expenses.—Under "Expenses" are included all items of expense incident to the year's business, except interest, whether on bonds or other forms of indebtedness, and allowances for depreciation.

Value of products.—The amounts given under this heading represent the selling value or price at the mill of all products manufactured during the year, which may differ from the value of the products sold.

Value added by manufacture.—The value of products is not a satisfactory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part of it, and often by far the larger part, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry is the value created by the manufacturing operations carried on within the industry. This value is obtained by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—Census data do not show the entire cost of manufacture, and consequently can not be used to show profits. No account has been taken of interest or depreciation. Even if the amount of profit could be determined by deducting the expenses from the value of the products, the rate of return on the investment could not properly be calculated, because of the very defective character of the figures regarding capital.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally electric, rented by them from other concerns. It does not cover the electric power developed by the primary power of the establishments themselves, the inclusion of which would evidently result in duplication.

COMBINED TEXTILES

COMBINED TEXTILES.

GENERAL STATISTICS.

The group of textile industries for which statistics are here presented comprises eight distinct industries, designated as follows: (1) "Cotton goods, including cotton small wares"; (2) "woolen, worsted, and felt goods, and wool hats"; (3) "carpets and rugs, other than rag"; (4) "hosiery and knit goods"; (5) "silk and silk goods, including throwsters"; (6) "cordage and twine and jute and linen goods"; (7) "shoddy"; and (8) "dyeing and finishing textiles." The statistics for each of these industries are presented in detail in subsequent chapters of this report. In addition, a separate presentation is made for the wool scouring and

the wool pulling industries, though none of the statistics for them have been included in the tables relating to the general textile group. This group of industries does not include the manufacture of rag carpets, haircloth, or fur-felt hats, which industries are presented in the general statistics of manufactures under classifications as follows: "Carpets, rag," "hats, fur-felt," and "haircloth."

Summary for 1909.—Table 1 presents a summary of the principal statistics relating to the eight industries constituting the combined textile group for the census of 1909.

In compiling the statistics for the eight industries named, each establishment has been classified according to its product of chief value. There is considerable overlapping among the different industries, but so far as possible the statistics of products common to two or more of the industries are assembled, in the chapter on the industry for which they constitute primary products, so as to show the total production of the given product in all industries combined. There is also considerable duplication in the cost of materials and value of products for some of the individual industries, and still more in the totals for the eight industries combined, by reason of the use of the products of one establishment or one industry as materials for other establishments or other industries. For example, some of the establishments classed under "cotton goods, including cotton small wares," make cotton yarn that is sold not only to other cotton mills but to establishments in other textile industries. The extent of this practice in the combined textile industry is shown by Table 10, which gives the statistics for yarns purchased. The combination of the value of products of the yarn-producing mills with that of the establishments in which the yarn is used as a material obviously leads to duplication. Again, the products of the shoddy industry are almost wholly used as a material in the wool manufactures.

In considering the relative importance of the several textile industries it should be borne in mind that the differences among the industries with respect to the amount of duplication involved in the value of products render that standard somewhat inaccurate.

It is clear from the table, however, that on the basis of any standard of measurement the cotton goods industry is the most important. The cotton mills, including those making small wares, manufactured products in 1909 whose value represented 37.3 per cent of the total value of products for the eight textile industries combined, and gave employment to 43 per cent of the total number of wage earners reported. Cotton is the most important material used in the manufacture of hosiery and knit goods also, and these two cotton-using industries together contributed 49.2 per cent of the total value of products for the eight

textile industries and employed 57.7 per cent of the total number of wage earners.

The industry designated "woolen, worsted, and felt goods, and wool hats" is the second in importance of this group, contributing 25.9 per cent of the total value of products and giving employment to 19.1 per cent of the total number of wage earners. In the carpet and rug branch of the industry also the chief material

used is wool, and these two industries together gave employment to 22.9 per cent of the wage earners and contributed 30.1 per cent of the value of products for the textile group.

Comparison with earlier censuses.—Table 2 summarizes the statistics of the eight textile industries representing the combined industry for each census from 1889 to 1909, inclusive.

¹ A minus sign (—) denotes decrease. Where percentages are omitted, comparable figures are not available.

² Comparable figures not available.

³ Figures not strictly comparable.

In comparing the figures for value of products and cost of materials for the different censuses, it should be noted that the amount of duplication may have been greater relatively at one census than at another, though it is probable that no very great change has taken place. Fluctuations in prices have, however, affected these items materially, and the value added by manufacture as well, though in the latter instance perhaps to a less extent. The advance in prices during the decade 1899-1909 partly accounts for the fact that the percentages of increase in these three items during that decade were much higher than those for the decade 1889-1899. The number of wage earners and the primary horsepower, however, also increased somewhat more rapidly during the later than during the earlier decade.

The average value of products per establishment in 1889 was \$173,836; in 1899, \$207,930; in 1904, \$258,747; and in 1909, \$314,768; and the average value added by manufacture in 1889 was \$71,060; in 1899, \$91,317; in 1904, \$99,749; and in 1909, \$129,298. The average number of wage earners per establishment shows an increase from 118 in 1889 to 147 in 1899, 157 in 1904, and 165 in 1909.

Comparative statistics for each census year beginning with 1879, for each of the textile industries covered by this report and for the eight industries combined, are presented in Table 3. In this table, for comparative purposes, "carpets and rugs" have been combined with "woolen, worsted, and felt goods and wool hats" under the title of "wool manufactures."

During the period of 30 years covered by the table the combined value of the products of the establishments in the eight textile industries increased from \$572,253,099 in 1879 to \$1,684,636,499 in 1909, the latter figure being nearly three times as great as the former. The decade 1899–1909 shows the largest absolute gain, the increase in value of products for that period being \$744,583,811.

A large gain during the last decade is shown for each of the separate industries with the single exception of the shoddy industry. The number of wage earners employed in these textile industries in 1909 was over twice as great as the number in 1879—881,128, as compared with 405,744—this increase comparing very favorably with the increase noted above for value of products.

Persons engaged in the combined textile industry.—Table 4 shows, for 1909, the number of persons engaged in the eight textile industries, classified according to occupational status and sex, and, in the case of wage earners, according to age also. It should be borne in mind that the sex and age classification of the average number of wage earners in this and other tables is an estimate obtained by the method described in the Introduction.

The average number of persons engaged in the eight textile industries during 1909 was 915,858, of whom 881,128, or 96.2 per cent, were wage earners, 19,209, or 2.1 per cent, were clerks, this class including other subordinate salaried employees, and 15,521, or 1.7 per cent, were proprietors and officials. Of the total number of persons engaged in the industry, 482,444, or 52.7 per cent, were males, and 433,414, or 47.3 per cent, were females. Of the wage earners, 71,426, or 8.1 per cent, were children under 16 years of age.

Table 4 CLASS.	PERSONS ENGAGED IN THE BINED TEXTILE INDUS

The proportion of the total formed by the several classes shows no great variation for the three census years, although there was an increase in the proportion of men during each five-year period and a decrease in the proportion of children, the proportion of females 16 years of age and over remaining practically stationary.

Prevailing hours of labor.—In Table 6 the wage earners in the eight textile industries combined have been classified according to the number of hours of labor per week prevailing in the establishments in which they were employed. In making this classification the average number of wage earners employed during the year in each establishment was classified as a total according to the hours prevailing in that establishment, even though a few employees worked a greater or smaller number of hours.

Total. Cotton goods, including cotton small wares. Woolen, worsted, and felt goods and wool hats. Hosiery and knit goods. Silk and silk goods, including throwsters. Dyeing and finishing textiles Carpets and rugs, other than rag. Cordage and twine and jute and linen goods. Shoddy.	881, 128 378, 880 168, 722 129, 275 99, 037 44, 046 33, 307 25, 820 2, 041	2, 156 304 423 908 106 107 165 138	11, 138 2, 879 1, 092 3, 331 2, 320 1, 102 178 208 28	18, 735 571 1, 102 4, 753 2, 323 398 7, 078 2, 505	516, 195 190, 998 119, 728 65, 422 81, 407 28, 172 13, 802 16, 279 387	12.639		1			

Of the total number of wage earners, 516,195, or 58.6 per cent, were employed in establishments where the prevailing hours of labor were more than 54 but less than 60 hours per week, while 259,407, or 29.4 per cent, were employed where the prevailing hours were 60 per week. The two groups above named together included 88 per cent of the total number of wage earners, and these same hours of employment were the most common ones in each of the individual industries. The larger proportion of the wage earners employed more than 60 hours per week (68,819 out of a total of 73,497) were in the cotton mills and the hosiery and knitting mills of the South. Of the 68,819 wage earners, the cotton mills reported 64,844, or 94.2 per cent, and the hosiery and knitting mills, 3,975, or 5.8 per cent.

Character of ownership.—Table 7 presents statistics with respect to the character of ownership of the establishments in the eight textile industries combined.

In 1909, of the total number of establishments in the eight industries combined, 60.3 per cent were under corporate ownership, as compared with 54.3 per cent in 1904, while the value of products of these establishments represented 84.3 per cent of the total in 1909 and 80 per cent in 1904.

Engines and power.—The amount of power used in the textile industries was first reported at the census of 1869. Table 2 shows that the total amount of power increased from 831,730 horsepower in 1889 to 2,099,050 in 1909. Table 8 shows, for the eight textile industries combined, the statistics of power, as reported at the censuses of 1909, 1904, and 1899.

¹ Not reported.

² Less than one-tenth of 1 per cent.

The total primary power used in the eight industries combined increased from 1,310,834 hosepower in 1899 to 2,099,050 horsepower in 1909, or 60.1 per cent. At each of the three censuses steam power constituted considerably more than two-thirds of the total primary power, the proportion being somewhat greater in 1904 than in either 1899 or 1909. Water power, which in 1899 formed 28.5 per cent of the total primary power formed but 20.8 per cent in 1909. There was a marked

increase, on the other hand, in the relative importance of the power of electric motors operated by purchased current (rented electric power). The amount of such power increased from 6,606 horsepower, or less than 1 per cent of the total primary power, in 1899, to 154,376 horsepower, or 7.4 per cent of the total, in 1909. The number and horsepower of electric motors used for distributing power by means of current generated in the establishment also shows a rapid increase.

SPECIAL STATISTICS RELATING TO MATERIALS AND EQUIPMENT.

Raw fibers used.—Table 9 gives the quantities of the several raw fibers used as materials in the eight textile industries in 1909 and 1899. Mills which con-

fine their consumption of raw material to some one fiber often buy yarns of other fibers for weaving; such consumption is not, however, covered by Table 9.

¹ Includes 7,938,735 pounds of camel, alpaca, vicuna, and mohair in 1909 and 6,217,641 pounds in 1899.

Cotton is the fiber most generally used as a material. and in 1909 the purchase of raw cotton was reported by all of the seven branches of the combined textile industry using raw fiber except the silk industry. In 1909 cotton formed 65.8 per cent of the entire amount of raw fiber used, as compared with 66.2 per cent in 1899. The increase between 1899 and 1909 in the amount of cotton used in the textile industries was 541,520,972 pounds, or 28.1 per cent. In the cotton goods industry (including the manufacture of cotton small wares), which in 1909 consumed 94.7 per cent of the cotton used in the combined textile industries, there was an increase of 517,701,516 pounds, or 28.5 per cent. There was an increase of 25,964,722 pounds, or 52.5 per cent, during the decade, in the amount of cotton used in the hosiery and knit goods industry, while in the manufacture of carpets and rugs there was an increase of 3,203,188 pounds, or 164.8 per cent. In the other branches of the woolen industry, on the other hand, there was a material decrease in the use of cotton between 1899 and 1909.

Hemp, jute, and similar fibers, other than flax. ranked next to cotton in quantity used (though not in value), but the consumption reported is confined almost exclusively to the industry designated "cordage and twine and jute and linen goods." Aside from fibers of this character, wool is next in importance as a material in the textile industries, comprising in 1909 14.9 per cent of the entire quantity of fiber reported. There was an increase in the consumption of wool from 1899 to 1909 of 147,105,216 pounds, or 35.6 per cent. The increase was practically confined to the carpet and rug and to the worsted and the felt goods branches of the woolen industry. In the carpet and rug industry the increase was 12,263,686 pounds, or 23.6 per cent; in the worsted goods branch of the woolen industry the increase was 207,739,479 pounds.

or 115.4 per cent; and in the felt goods branch the increase was 2,803,563 pounds, or 29.2 per cent. In the period from 1899 to 1909 there was a decrease in the quantity of wool used in the hosiery and knit goods and the shoddy industries, and in the woolen goods and wool hat branches of the woolen industry The greatest decrease is shown for the woolen goods branch of the woolen industry, which used 150,200,616 pounds of wool in 1899 and only 87,037,951 pounds in 1909—a reduction of 42.1 per cent. This does not indicate a falling off to that extent in the manufacturing capacity of the industry, but that owing to the demands of fashion, establishments which formerly engaged in the manufacture of woolen goods turned their attention to worsteds. In the hosiery and knit goods industry the decrease was 10,885,119 pounds. or 60.6 per cent.

The consumption of animal hair and fur by the combined industries was somewhat greater in 1909 than in 1899. There was a notable increase in the consumption of such material in the manufacture of shoddy, the quantity reported for 1909 being almost 24 times as great as that used in 1899.

The use of raw silk is practically confined to the silk industry, although in 1909 a small amount was used in the cotton goods industry. The increase between 1899 and 1909 in the quantity of raw silk used was 7,968,536 pounds, or 81.6 per cent. Some of the other textile industries, however, used considerable quantities of silk yarn. (See Table 10.)

Yarns purchased.—Table 10 shows, for 1909 and 1899, the quantity of purchased yarns used in the seven textile industries which use yarns, and in the branches of the cotton goods and woolen industries. The large quantities of yarns made in the same establishments which used them as material in further manufacture are not included.

Includes jute and other vegetable fiber yarns.
 Includes 1,494,586 pounds of mercerized cotton yarn.
 Includes 219,861 pounds of mercerized cotton yarn.

Included with "other kinds"
Tucludes hemp yarn.

An increased quantity of each kind of yarn was purchased in 1909 as compared with 1899 except in the case of linen yarn, for which a slight decrease is shown. Of the different kinds of yarns purchased silk yarn shows the largest percentage of increase in consumption (96.7 per cent), and cotton yarn the next largest (46.7 per cent). The amount of linen yarns purchased descreased 2.7 per cent, while that of jute, ramie, and other vegetable fiber yarns increased 42.6 per cent, and that of woolen, worsted, and merino yarns 37.3 per cent.

Purchased cotton yarn was used in each of the seven branches of the combined textile industry covered by the table except the wool hat and shoddy industries, and, except in the woolen mills, larger quantities were used in 1909 than 1899. Purchased woolen, worsted, and merino yarns were used in 1909 in every industry covered by the table except the manufacture of cordage and twine and jute and linen goods and wool hats. The amount of purchased silk yarn used shows relatively large increases in practically every branch of the combined textile industry.

More than four-fifths (82.5 per cent) of the purchased linen yarns and nearly 95 per cent of the purchased jute yarns in 1909 were used in the carpet and rug industry, the quantities used being greater that year than in 1899.

Total production and consumption of cotton and woolen yarns.—The returns for 1909 permit of a tabulation of the total production and the total consumption of cotton, woolen and worsted, and merino yarns in the textile industries, as each establishment reported the quantities of these yarns made for its own consumption, the quantities made for sale, and the quantities of purchased yarns used. Table 11 presents statistics on this subject for the several industries.

Of the total production of cotton yarn in the textile industries in 1909, 1,647,131,776 pounds, or 77.4 per cent, was made for consumption in the establishment producing and 482,046,102 pounds, or 22.6 per cent, for sale. The total consumption in the seven industries covered by Table 11 includes 430,483,305 pounds purchased in addition to that made for consumption in the mills producing. The excess of the total production over the total consumption in these industries was 51,562,797 pounds, which is equal to 2.4 per cent of the production; this represents approximately the quantity of cotton yarn used in other industries and in the hand trades, that exported, and in stocks on hand

at close of the year. In like manner the excess of the production shown over the consumption of woolen and worsted yarns in the specified industries was 2,894,107 pounds, or eight-tenths of 1 per cent of the total production; and in the case of merino yarns, 7,305,393 pounds, or 10.9 per cent of the total production.

Production, imports, exports, and consumption of raw fibers.—Table 12 shows, for the United States as a whole, the production, imports, exports, and consumption of the leading raw fibers for 1909, 1899, and 1889, together with the total value and average value per pound of the imports and exports, respectively.

The aggregate quantity of textile fibers produced in the United States in 1909, as shown in the table, was 5,497,285,000 pounds, as compared with 4,055,298,000 pounds in 1889, the increase for the 20-year period being 1,441,987,000 pounds, or 36 per cent. During the same period the imports of textile fibers increased from 557,688,000 pounds to 1,054,545,000 pounds, or 89 per cent, the exports from 2,489,050,000 pounds to 3,241,824,000 pounds, or 30 per cent, and the consumption in the United States from 2,021,224,000 pounds to 3,740,369,000 pounds, or 85 per cent.

The United States used more than one-fifth of the world's production of raw silk in 1909, ranking next to China in the consumption of this product. The increasing importance of manila hemp and sisal in the manufacture of cordage and twine is noteworthy. By far the greater portion of the jute imported is used in the manufacture of gunny bagging or burlap, large quantities of which are used for covering cotton bales, for grain sacks, and for various other purposes.

PRODUCTION, IMPORTS, EXPORTS, AND CONSUMPTION OF THE LEADING RAW TEXTILE FIBERS: 1909, 1899, AND 1889.

[The statistics for production were collected by the Bureau of the Census, except for flax for 1909, and for wool. Those for imports and exports were obtained from the reports of the Bureau of Foreign and Domestic Commerce, Department of Commerce. For some of the other figures, nonofficial sources have been consulted, and for these only an approximation to the facts is claimed. The statistics for production are for the growth year, those for imports and exports for the fiscal year beginning July 1, and those for consumption for the census year.]

3 Includes manila.

4 The base of the state of

Table 13 gives the world's production of the leading textile fibers, by countries, for 1909, 1899, and 1889. It may be noted that although a considerable amount of flax is raised in the United States, most of it is grown for the seed alone, and only rough estimates are available for the small production of flax fiber utilized as a textile material.

In 1909 the United States produced 31 per cent of the total reported production of the leading textile fibers, 49 per cent of the two most important fibers, cotton and wool, combined, and 61 per cent of cotton alone. The cotton crop of the United States in 1909 was below the normal; the country, however, supplied about two-thirds of the world's production in 1907 and 1908, and more than seven-tenths in 1911.

The relative importance of the textile fibers named in the table has undergone considerable change since the beginning of the nineteenth century. Flax, which

8 Arrived at by subtraction. Sisal is included.

was used to a larger extent than any other fiber in 1800, now ranks fourth, and the quantity of flax produced is only about three times as large as at the beginning of the last century. The production of wool, on the other hand, has increased from about 500,000,000 pounds in 1800 to nearly 2,800,000,000 pounds, or more than five times as much, in 1909, and the production of cotton from about 300,000,000 pounds to 8,505,000,000 pounds, or more than twenty-eight times as much. The most remarkable increase, however, has been in the production of jute, the quantity of this fiber produced in 1850 being about 60,000,000 pounds, as compared with 2,918,000,000 pounds in 1909.

The increase in the world's production of textile fibers between 1889 and 1909 were as follows: Cotton, 45 per cent; wool, 13 per cent; silk, 112 per cent; flax, 86 per cent; and jute, 57 per cent. Hemp shows a decrease of 1 per cent.

⁴ Arrived at by subtraction. Manila hemp is included.

WORLD'S PRODUCTION OF THE LEADING TEXTILE FIBERS: 1909, 1899, AND 1889.

The statistics for the United States were collected by the Bureau of the Census, except those for flax for 1909, and for wool. These statistics, as well as the statistics for foreign countries, have been compiled from a number of sources. Among them are reports of the National Association of Wool Manufacturers, Boston, of the Flax Supply Association, Belfast, of Russian Departments of Commerce and Agriculture, St. Petersburg, and of the Silk Association of America, New York, and data furnished by the International Flax Twine Co., Chicago, by the Columbia Rope Co., Auburn, N. Y., and by Ralli Bros., New York. Since it has not been practicable to secure satisfactory data in all instances, only an approximation to the facts is claimed for the statistics not collected by special inquiries.]

The total estimated production for 1909 of the leading textile fibers, as shown in the table, was 17,594,356,000 pounds, of which cotton constituted 48 per cent; wool, 16 per cent; silk, about one-half of 1 per cent; flax, 11 per cent; hemp, 8 per cent; and jute, 17 per cent. During the 20 years covered by the table the proportion which cotton constituted of all fibers increased from 46 to 48 per cent, that for flax from 8 to 11 per cent, and that for jute from 15 to 17 per cent; silk also showed a slight increase in the proportion which it represented of the total, while the proportions represented by wool and hemp decreased. The total supply of these textile fibers in commercial channels

at the beginning of the nineteenth century amounted to approximately 1,400,000,000 pounds, of which cotton formed about 22 per cent; wool, 33 per cent; silk, 2 per cent; and flax, 43 per cent.

5 Included in "all other countries." ⁶ The figures celate to 1902

Producing spindles.—Table 14 gives the number of producing spindles in active textile mills at the time of each census from 1869 to 1909, inclusive. It does not include spindles in establishments engaged primarily in the manufacture of products other than textiles, nor spindles employed on flax, hemp, jute, and allied fibers, of which latter class 142,169 were returned in 1909; nor does it include doubling and twisting spindles which do not use raw fiber.

Does not include Tussah silk.
 Except for the United States and the United Kingdom, the figures are for 1900.
 Except for the United States, the figures relate to 1801.
 The figures relate to 1908.

⁷ The figures relate to 1895. 8 Exports, instead of production.

Table 14		NUMBER OF PRODUCING SPINDLES.												
CENSUS YEAR.	Total.	Cotton spindles.	Silk spindles.	Woolen spindles.	Worsted spindles.									
1909	33,866,479 28,721,742 23,901,557 118,092,133 113,170,743 19,338,953	28, 178, 862 23, 672, 064 19, 403, 984 14, 384, 180 10, 653, 435 7, 280, 800	1,777,962 1,394,020 1,213,493 718,360 262,312 12,040	2,156,849 2,456,389 2,229,181 2,332,269 1,915,070 1,845,496	1, 752, 806 1, 199, 269 994, 899 657, 324 ,339, 926 200, 617									

1 Includes some accessory spindles, except for silk.

The percentage of increase from 1899 to 1909 in the total number of spindles was greater than that for any other decade shown. In 1909 cotton spindles formed 83.2 per cent of the total number, silk spindles, 5.2 per cent, and woolen and worsted spindles combined, 11.5 per cent. In 1909 cotton spindles represented a slightly larger proportion of all spindles than in 1904 and 1899, and woolen and worsted spindles combined a slightly smaller proportion.

Looms.—The number of power and of hand looms, respectively, used in the manufacture of the several kinds of textiles, as reported for each census year from 1869 to 1909, is shown in Table 15. It does not include looms in establishments engaged primarily in the manufacture of products other than textiles, nor looms employed on flax, hemp, jute, and similar fibers.

The increase in the total number of power looms from 1899 to 1909 was 252,264, or 44 per cent. There was an increase from 1899 to 1909 in the number of each kind of power looms shown in the table except

the woolen looms, which decreased in number, though the combined number of woolen and worsted looms increased. The largest relative increase from 1904 to 1909 was in the worsted looms (power looms only), 40.4 per cent; the number employed on silk goods increased 26.1 per cent and the number on cotton goods 18.9 per cent. Cotton looms operated by power formed 80.6 per cent of the total number of looms in 1909 as compared with 79.5 per cent in 1899; silk power looms, 9.1 per cent as compared with 7.7 per cent; woolen power looms, 4 per cent as compared with 6.4 per cent; and worsted power looms, 4.8 per cent as compared with 4.6 per cent. The use of hand looms has been decreasing very rapidly since 1879 and their number in 1909 was insignificant.

COTTON MANUFACTURES

COTTON MANUFACTURES.

GENERAL STATISTICS FOR THE INDUSTRY AS A WHOLE.

Scope of the industry.—Under the census classification "cotton goods, including cotton small wares." two classes of mills are distinguished: (1) those producing "cotton goods," including mills engaged in the spinning of cotton or in the weaving of piece goods, or in both of these processes; and (2) those producing "cotton small wares," including establishments manufacturing narrow fabrics, such as tapes, webbing and mill banding, braids, shoe and corset laces. and similar goods. All establishments producing piece goods are included in the former group, even though manufacturing some narrow woven goods or braids; and the latter group includes some establishments that do spinning, but only in cases where the varns are used by the establishment in the manufacture of cotton small wares.

Summary for the industry: 1909.—Table 1 presents a summary of the statistics of the cotton goods industry as a whole for 1909.

Table 1	Total for the	ESTABLISHMEN PRIMARILY TURING—	TS ENGAGED IN MANUFAC-
	industry.	Cotton goods.	Cotton small wares.
Number of establishments. Persons engaged in the industry. Proprietors and firm members. Salaried employees. Wage earners (average number). Primary horsepower. Capital. Expenses. Services. Salaries. Wages. Miscellaneous. Value of products. Value added by manufacture (value of products less cost of materials).	387, 771 8,77 8,514 378, 880 1,296, 517 \$822, 237, 529 554, 221, 688 147, 270, 903 14, 411, 758 132, 859, 145 371, 1009, 470	1, 208 379, 538 8, 053 371, 182 1, 286, 105 542, 483, 004 143, 504, 935 13, 715, 218 129, 789, 717 304, 013, 504 34, 934, 565 615, 217, 702 251, 204, 198	110 8, 233 74 4601 7, 698 10, 412 \$13, 524, 772 11, 768, 684 3, 705, 908 6, 905, 540 3, 069, 428 6, 905, 966 1, 000, 750 13, 174, 111 6, 178, 145

Of the two branches of the industry the cotton goods branch is by far the more important, comprising 91.2

per cent of the total number of establishments in the industry in 1909, and contributing 97.9 per cent of the total value of products.

Comparison with earlier censuses.—The first census at which statistics were obtained for the cotton goods industry was that of 1839. At that census 1,240 establishments were reported, giving employment to 72,119 persons, with products valued at \$46,350,453; for 1849, 1,094 establishments were reported, giving employment to 92,286 hands, and manufacturing products valued at \$61,869,184; and in 1859 there were 1,091 establishments, employing 122,028 hands, and with a value of products amounting to \$115,681,774.

Table 2 summarizes the statistics of the industry (the manufacture of cotton goods and of cotton small wares combined) for each census from 1869 to 1909, inclusive. Prior to the census of 1899 no distinction was made between plants manufacturing cotton goods and those manufacturing cotton small wares, but at that census and also at the censuses of 1909 and 1904 they were reported separately. In this and all following tables, however, the statistics for the two classes of establishments are combined, except as especially noted.

The financial figures for 1869 are given in currency, which at that time was worth only about 80 cents, gold, to the dollar. For strict comparison, therefore, these figures should be reduced about 20 per cent.

The figures for 1879 do not include those for 249 mills, employing 12,928 hands, classed as "special mills," which were engaged in the manufacture of hosiery, webbing, tapes, and fancy fabrics, and mixed goods or other fabrics not sold as specific manufactures of wool or cotton. The cotton used in these mills cost \$2,338,385, and the value of their products was \$18,860,273.

The cotton goods industry is one of the oldest and most typical factory industries in the United States. In 1909 it ranked third among the industries of the country in number of wage earners, being exceeded only by the lumber industry and the foundry and machine-shop industry, and seventh in value of products and in value added by manufacture.

The value of products reported for 1909, which, however, involves considerable duplication, was \$628,391,-813. The total cost of materials was \$371,009,470, which was nearly three-fifths (59 per cent) of the total value of products, while the value added by manufacture (that is, the value of products less the cost of materials) was \$257,382,343.

The industry gave employment to an average of 387,771 persons, of whom 378,880 were wage earners. The amount paid in salaries and wages was \$147,270,903, which is equal to considerably more than half of the value added by manufacture.

The industry has had a steady growth throughout the 70 years for which statistics are available, the value of products in 1909 being more than thirteen times as great as in 1839, and the number of wage earners more than five times as great, while the number of establishments shows an increase of 84, or 6.8 per cent. For most of the items covered by the table the percentages of increase for the decade 1899–1909 were higher than those for any other decade. The advance in the prices of commodities during the past decade, however, doubtless accounts in part for some of these increases.

Summary, by states.—Table 3 summarizes the more important statistics of the industry by states, the states being arranged according to the value of products reported for 1909. In determining the rank of the states, all states are considered, regardless of whether or not they are shown in the table; hence some omissions occur in the several series of numbers indicating rank, as certain states included under "all other states" held a higher rank in some items than some of the states for which separate figures are given.

¹ Percentages are based on figures in Table 45. A minus sign (—) denotes decrease. Percentage not shown where base is less than \$100,000 for value added by manuacture, or where comparable figures can not be given without disclosing individual operations.

2 Less than one-tenth of 1 per cent.

The industry is confined almost entirely to the states east of the Mississippi River. From the territory west of that river only 20 establishments were reported, these being distributed among five states, as follows: Texas, 13 establishments; Louisiana, 2; Missouri, 2; Arkansas, 2; and Kansas, 1. Among the states east of the Mississippi, on the other hand, there were only three states, namely, West Virginia, Florida, and Michigan, which were without cotton mills. Massachusetts is the most important state, ranking first both in 1909 and in 1904 in average number of wage

earners, value of products, and value added by manufacture. In the year 1909 this state employed 28.7 per cent of the total number of wage earners and contributed 29.7 per cent of the total value of products for the United States. The number of wage earners in the cotton goods industry in Massachusetts increased 17.7 per cent during the decade 1899–1909, and the value of its products 67.8 per cent. North Carolina ranked second in 1909 both in number of wage earners and in value of products, and South Carolina third, these two states having changed places since

COTTON. 39

1904. Rhode Island ranked fourth in value of products in 1909, having advanced from fifth place in 1904, and fourth in the number of wage earners employed, the same position as in 1904; in value added by manufacture, however, it ranked second in 1909, having advanced from third place in 1904. Georgia, Pennsylvania, New Hampshire, Connecticut, and Alabama, in the order named, were the states next in rank in value of products in 1909.

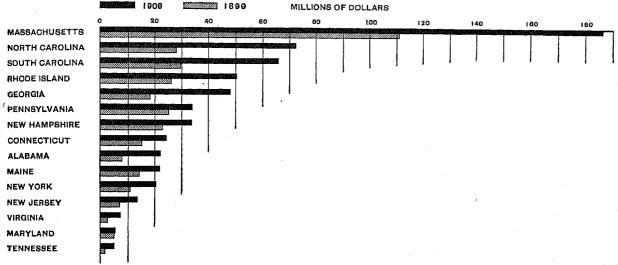

Eight of the states listed in Table 3 show an increase of over 100 per cent for the period 1899–1909 in value of products, and seven of the eight show a gain of over 50 per cent in number of wage earners. In general, the percentages of increase in the leading Southern cotton manufacturing states were decidedly greater

than those in the Northern states. Among the 10 leading states, Alabama shows the highest percentage of increase for the decade in value of products, and North Carolina the highest in number of wage earners; for the five-year period 1904–1909, however, North Carolina shows the greatest relative increase in both items.

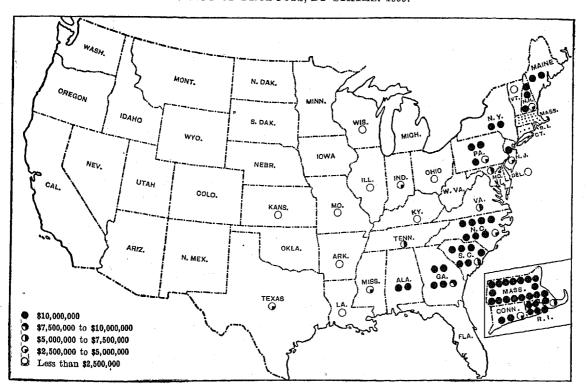

Most of the states held the same, or practically the same, rank in value added by manufacture in 1909 as in value of products.

The diagram below shows graphically the value of products reported for the most important states in the industry as a whole in 1909 and 1899, while the map shows the distribution of the value of products by states in 1909.

VALUE OF PRODUCTS FOR THE MOST IMPORTANT STATES: 1909 AND 1899.

VALUE OF PRODUCTS, BY STATES: 1909.

PERSONS ENGAGED IN THE INDUSTRY.

Summary: 1909.—Table 4 shows, for 1909, the number of persons engaged in the industry as a whole and in each of its branches, classified according to occupational status and sex, and in the case of wage earners, according to age also. It should be borne in mind that the sex and age classification of the average number of wage earners in this and other tables is an estimate obtained by the method described in the Introduction.

Table 4 BRANCH OF THE INDUSTRY AND CLASS OF		ENGAGED USTRY: 190

Wage earners (average number)	7,698	2,662	5,036
16 years of age and over	7, 216 482	2, 553 109	4,663 373

The average number of persons engaged in the cotton manufacturing industry as a whole during 1909 was 387,771, of whom 378,880, or 97.7 per cent, were wage earners; 4,461, or 1.2 per cent, were proprietors and officials; and 4,430, or 1.1 per cent, were clerks, this class including other subordinate salaried employees. Of the total number, 221,299, or 57.1 per cent, were males, and 166,472, or 42.9 per cent, were females. Of the clerks, 23 per cent were females, and of the wage earners over 16 years of age, 43.2 per cent. The average number of children under 16 years of age employed as wage earners was 39,306, of whom nearly onehalf were girls. Children constituted 10.4 per cent of the total number of wage earners. The larger proportion of proprietors and officials in the cotton small wares branch of the industry is in part due to the generally smaller size of the establishments.

In order to compare the distribution of the persons engaged in the industry according to occupational status in 1909 with that in 1904, it is necessary to use the classification employed at the earlier census. (See Introduction.) Such a comparison is made in Table 5.

Table 5	PERSONS	ENGAGE BRANC	D IN THE	INDUSTRY	-вотн

1 A minus sign (—) denotes decrease.

Each of the three classes shown in the table represented the same proportion of the total in both census years.

Table 6 shows the average number of wage earners in the industry as a whole, distributed according to age, and in the case of those 16 years and over, according to sex, for 1909, 1904, and 1899.

Table 6	AVERAGE NUMBER OF WAGE EARNERS IN THE INDUSTRY—BOTH BRANCHES COMBINED.											
CLASS.	190	9	190	4	189	99						
, ,	Number.	Per cent distri- bution.	Number.	Per cent distri- bution.	Number.	Per cent distri- bution.						
Total 16 years of age and over Male Female Under 16 years of age	378, 880 339, 574 192, 930 146, 644 39, 306	100. 0 89. 6 50. 9 38. 7 10. 4	315,874 275,446 147,283 128,163 40,428	100. 0 87. 2 46. 6 40. 6 12. 8	302,861 262,603 135,721 126,882 40,258	100, 0 86, 7 44, 8 41, 9 13, 3						

The percentages of women and children employed decreased during each of the intercensal periods covered by the table, though the actual number of women employed was greater in 1909 than in either of the two earlier years.

The average number of wage earners in each state in 1909, 1904, and 1899 is given in Table 45. The distribution of the average number by sex and age is not shown for the individual states, but Table 46 gives such a distribution of the number employed on December 15, 1909, or the nearest representative day. The largest number of female wage earners employed in any state was 51,238 in Massachusetts, and the next largest number, 19,052, in North Carolina.

In three of the Southern states—Alabama, North Carolina, and South Carolina—nearly 19 per cent of all wage earners in the industry in 1909 were children under 16 years of age. In Massachusetts, the leading state in the industry, however, only 5.7 per cent were children.

The proportion of women employed was much larger in Massachusetts, New Hampshire, and Rhode Island than in the Southern states shown, the percentage in New Hampshire being 48.3, that in Rhode Island 43.3, and in Massachusetts 43.1.

COTTON. 41

Wage earners classified according to nature of employment.—The enumeration of spinners and weavers in cotton mills was first attempted at the census of 1899, but the form of the inquiry was so defective that it is not deemed advisable to place the data in comparison with that secured in 1909 and 1904. At the census of 1904 and again in 1909 a more satisfactory enumeration of the spinners and weavers employed in the industry was made. Table 7 shows, for the United States for 1909 and 1904, and for selected states for 1909, the distribution by sex and age of spinners, weavers, and all other wage earners. It should be

noted that the absolute figures for the two censuses are not strictly comparable, owing to the fact that the numbers shown for 1904 are computed averages for the entire year, while those for 1909 are the numbers reported for December 15, or the nearest representative day. The difference between the number of wage earners on this day and the average number for the year, however, was only 8,818, or a little more than 2 per cent of the total; and since there is little variation from month to month in the proportion of the different classes of employees, the figures representing the per cent distribution are fairly comparable.

1 For 1909 the figures are those reported for the 15th day of December, or the nearest representative day; for 1904 the average number is given.

Of the total number of wage earners in 1909, 17.4 per cent were spinners and 26.4 per cent were weavers. In 1904 spinners constituted 19.1 per cent and weavers 32.2 per cent of the total number of wage earners. The marked decline in the proportion of weavers is due in a measure to the more general installation of automatic looms, which make possible a great increase in the output per weaver.

The number of spinners in 1909 exceeded the number of weavers in each of the Southern states shown—Alabama, Georgia, North Carolina, and South Carolina—

while in Massachusetts, New Hampshire, and Rhode Island the weavers outnumbered the spinners. This difference is due to the fact that in the Northern states the proportion of finer and more elaborate fabrics woven is greater than in the Southern states.

Table 8 shows, for the United States as a whole for 1909 and 1904, and for certain important states in the industry for 1909 only, the percentage of men, women, and children, respectively, in the total number of wage earners and in each of the three classes for which statistics are presented in Table 7.

Of the total number of spinners in 1909, 44.6 per cent were women 16 years of age and over, and 25.1 per

cent were children under 16 years of age, the corresponding percentages for 1904 being 42.6 and 31.6. Among the weavers in 1909, 44.7 per cent were women and 3.2 per cent were children under 16 years of age, the proportion of women being somewhat lower and that of children somewhat higher than in 1904. The Southern states for which separate figures are presented show relatively high percentages of children for each of the three classes of wage earners for which figures are given in the table, as well as for the total number. In South Carolina, for example, 40.2 per cent of the spinners in 1909 were children under 16 years of age, as compared with 7.2 per cent in New Hampshire, and 6.3 per cent of the weavers, as compared with 1.4 per cent in New Hampshire.

Wage earners employed, by months.—Table 9 gives the number of wage earners employed on the 15th (or the nearest representative day) of each month during the year 1909 for each state in which an average of 500 or more wage earners were employed during the year, for which figures can be shown without disclosing individual operations.

The largest number of wage earners employed during any month of 1909 was 383,529, in December, and the smallest number, 374,433, in January, the minimum number being equal to 97.6 per cent of the maximum. The gradual increase in the number from May to December may probably be ascribed to the better industrial conditions existing at the close of the year. The industry, while not subject to material seasonal variations, is usually more active during the winter months than in the summer. In 1904 the maximum number of wage earners, 330,057, was reported for January, and the minimum number, 284,744, for August, the latter number being equal to 86.3 per cent of the former.

¹ The month of maximum employment for each state is indicated by boldface figures and that of minimum employment by italic figures.

COTTON. 43

Table 9 shows further that in the two foremost states, Massachusetts and North Carolina, the greatest activity occurred during December, while for South Carolina, the third state in respect to number of wage earners, the largest number was reported for July. In most of the states for which figures can be presented, however, there was no considerable variation in the number employed during the year. The months of maximum and minimum employment for 1909 and the number of wage earners reported for these months are given for 21 states in Table 46.

Prevailing hours of labor.—In Table 10 the wage earners in the cotton manufacturing industry have been classified according to the number of hours of labor per week prevailing in the establishments in which they were employed. In making this classification the average number of wage earners employed during the year in each establishment was classified as a total according to the hours prevailing in that establishment, even though a few employees worked a greater or smaller number of hours.

Practically one-half (50.4 per cent) of the wage earners employed in the cotton manufacturing industry in 1909 were in establishments where the prevailing hours were between 54 and 60 per week, and nearly one-third (31.5 per cent) were employed in establishments where the hours were 60 per week, these two classes of establishments giving employment to 81.9 per cent of the total number of wage earners in the industry. Only 1 per cent of the total were employed in establishments where the usual hours were 54 or less per week, and 17.1 per cent in establishments where more than 60 hours per week were required,

practically all of these latter being in Southern states. All of the wage earners in New Hampshire and nearly all of those in Massachusetts, Rhode Island, and Connecticut were in establishments where the prevailing hours were more than 54 but less than 60 per week, 90.7 per cent of the total number of wage earners in this group being reported from these four states. On the other hand, 84 per cent of the 47,231 wage earners in North Carolina and 57.2 per cent of the 27,803 wage earners in Georgia were employed in establishments where the prevailing hours of labor per week were more than 60 but less than 72, while 99 per cent of the wage earners in South Carolina were in establishments operating on a 60-hour basis.

CHARACTER OF OWNERSHIP.

Table 11 presents statistics with respect to the character of ownership of the establishments in the cotton manufacturing industry.

Table 11	COTTON	oods, inc	LUDING COTTON	SMALL WARES.

¹ Includes one establishment under "other" ownership, to avoid disclosure of individual operations.

Of the total number of mills reported for the industry in 1909, 84.1 per cent were under corporate ownership, as compared with 79.9 per cent in 1904; of the total value of products the corporate establishments contributed 95.3 per cent in 1909 and 92.8 per cent in 1904. These figures indicate a slight gain during the five-year period in the relative importance, as measured by value of products, of establishments under corporate ownership.

Of the total number of wage earners reported for the cotton manufacturing industry in 1909, 5,366, or 1.4 per cent, were employed in establishments under individual ownership; 11,250, or 3 per cent, in those under firm ownership; and 362,264, or 95.6 per cent, in those owned by corporations.

Table 12 gives statistics for establishments classified according to form of ownership for each state in which an average of more than 500 wage earners were employed in 1909 for which figures can be shown without disclosing individual operations.

Note.—In some states, in order to avoid disclosing the returns for individual establishments, the figures for one group have been consolidated with those for establishments under some other form of ownership. In such cases an (X) is placed in the column from which the figures have been omitted and the figures for the group with which they have been combined are printed in italics.

The corporate form of ownership was the only form reported in seven of the states listed and was the prevailing form in all of them. Pennsylvania was the only state in which establishments under individual and firm ownership formed any considerable proportion of the total. In that state, however, these two groups constituted 27.4 per cent and 24.6 per cent, respectively, of the total number of establishments, employed 14.9 per cent and 21.7 per cent, respectively, of the total number of wage earners, and contributed 15.8 per cent and 19.5 per cent, respectively, of the total value of products.

SIZE OF ESTABLISHMENTS.

Classification by value of products.—Table 13 presents statistics for 1909 and 1904 for establishments grouped according to the value of their products.

1 Less than one-tenth of 1 per cent.

Of the 1,324 establishments reported for 1909, 163, or 12.3 per cent, manufactured products valued at

\$1,000,000 or over. In 1904 there were 99 establishments of this class out of a total of 1,154, or 8.6 per cent. While such establishments represented a comparatively small proportion of the total number at both censuses, they reported 52.9 per cent of the total value of products in 1909 and 43.9 per cent in 1904. In 1909 there were included in this group 5 establishments with products valued at \$5,000,000 or over, the aggregate value of their products exceeding \$37,000,000.

In considering the increase between 1904 and 1909 in the proportion of the business controlled by large establishments, it should be borne in mind that in consequence of the marked increase which has taken place in the prices of commodities during this five-year period, establishments might pass from the next lower class into the class comprising establishments having products valued at \$1,000,000 or over without a corresponding increase in the volume of their output.

The small establishments—that is, those manufacturing products valued at less than \$20,000—constituted a very small proportion of the total number at both censuses, and the value of their products formed only one-tenth of 1 per cent of the total. The establishments with products between \$100,000 and \$1,000,000 in value constituted 60.3 per cent of the total number in 1909 and contributed 44.2 per cent of the total value of products; in 1904, however, they were the most important class as measured by value of products, reporting 52.4 per cent of the total.

The average value of products per establishment increased from \$390,353 in 1904 to \$474,616 in 1909, and the average value added by manufacture, as computed from the figures in Table 2, from \$142,298

45

to \$194,398, these increases being probably due in part to advances in the prices of products. The average number of wage earners, however, likewise increased, from 274 in 1904 to 286 in 1909.

Classification by number of wage earners.—Table 14 classifies the establishments in the cotton manufacturing industry in 21 of the leading states according to the number of wage earners employed.

Of the 1,324 establishments reported for 1909, 3 employed no wage earners, 37, or 2.8 per cent, employed from 1 to 5, 21.4 per cent employed from 6 to 50, and 16.9 per cent from 51 to 100. The largest single class consisted of 360 mills employing from 101 to 250 wage earners, though 204 mills gave employment to over 500 wage earners each. Of the total number of wage earners reported, 2.1 per cent were in establishments employing from 1 to 50 wage earners, 4.3 per cent in establishments employing from 51 to 100, 15.6 per cent in establishments employing from 101 to 250, 20.3 per cent in establishments employing from 251 to 500, 23.4 per cent in establishments employing from 501 to 1,000, and 34.3 per cent in establishments employing over 1,000. Establishments employing 1,000 wage earners or more were relatively more important in Maine, New Hampshire, Virginia, Massachusetts, and New York than in any of the other states, more than half of the wage earners in each of these five states being employed in establishments of this class.

EXPENSES.

As stated in the Introduction, the census figures representing expenses do not purport to show the total cost of manufacture, since they take no account of interest or depreciation; hence they can not properly be used for determining profits. Facts of interest can be brought out, however, concerning the

relative importance of the different classes of expenses which were reported. Table 2 shows the total expenses reported for the industry in 1909 to have been \$554,221,688, distributed as follows: Cost of materials, \$371,009,470, or 66.9 per cent; wages, \$132,859,145, or 24 per cent; salaries, \$14,411,758, or 2.6 per cent; and miscellaneous expenses, made up of advertising, ordinary repairs of buildings and machinery, insurance, traveling expenses, and other sundry expenses, \$35,941,315, or 6.5 per cent. In establishments making cotton goods, the proportions were: Cost of materials, 67.2 per cent; wages, 23.9 per cent; salaries, 2.5 per cent; and miscellaneous expenses, 6.4 per cent. In the cotton small wares branch of the industry, the corresponding percentages were 59.4. 26.1. 5.9, and 8.6, respectively.

Table 15 shows in percentages, by states, the distribution of the total expenses reported for the cotton manufacturing industry as a whole in 1909.

There are considerable variations in the proportions represented by the different classes of expenses in the several states, but the cost of materials constituted over three-fifths of the total in all the 21 states shown in the table except Illinois, while the proportion for wages ranged from 15.5 per cent in Ohio to 30.2 per cent in Maine. In all of the Southern states, together with Ohio, Indiana, New Jersey, New York, and Pennsylvania, the percentage represented by wages was lower than the average for the United

States as a whole (24 per cent), while in Maine, New Hampshire, Rhode Island, Connecticut, Illinois, and Massachusetts it was higher. States showing a high percentage for wages almost uniformly show a low percentage for materials, as is natural, since wages and cost of materials together make up by far the larger part of the total expenses reported. The differences in the proportions in the different states are attributable in part to differences in wage scales and in part to differences in the fineness and the degree of elaboration of the products, the manufacture of fine or highly elaborated products requiring more labor in proportion to the quantity of materials and more highly skilled labor than the manufacture of a lower grade of products.

ENGINES, POWER, AND FUEL.

Engines and power.—The amount of power used in the cotton manufacturing industry was first reported at the census of 1869. Table 2 shows that the total primary power used in the industry as a whole increased from 146,040 horsepower in 1869 to 1,296,517 in 1909. Table 16 shows statistics of power as reported at the censuses of 1909, 1904, and 1899.

The total primary power increased from 795,834 horsepower in 1899 to 1,296,517 horsepower in 1909, or 62.9 per cent. In 1909, as in 1904 and 1899, the power of steam engines constituted more than two-thirds of the total primary power, the percentage in 1909 (67.1), though somewhat less than that in 1904, being slightly greater than in 1899. Water power, which in 1899 formed nearly one-third (31.6 per cent) of the total primary power, constituted in 1909 only 23.4 per cent of the total. There was a marked increase, on the other hand, in the relative importance of power generated by electric motors operated by purchased current (rented electric power), which increased from 2,081 horsepower in 1899 to 108,512

horsepower in 1909, or from three-tenths of 1 per cent of the total primary power used in the industry to 8.4 per cent. These changes are partly attributable to the marked growth of this industry in the Southern states, where the use of rented electric power has increased most conspicuously—much of the current being generated at a low cost by water power.

¹ Less than one-tenth of 1 per cent.

The number and horsepower of electric motors used for distributing power by means of current generated in the establishments in the industry also show a very large increase, the horsepower of such motors increasing from 15,513 in 1899 to 127,390 in 1909.

Table 17 shows for 1909 the amount of the several kinds of power and of the different kinds of fuel used in 21 of the leading states.

The states which ranked highest with respect to the amount of power used were Massachusetts, South Carolina, North Carolina, Rhode Island, and Georgia. The total horsepower reported for these states in 1909 was 902,625, or 69.6 per cent of the total for the entire industry in the United States. Steam was the most important form of primary power in all the states shown separately except Maine and Virginia, in which states water power was used to a greater extent than any other form of power. The largest amounts of steam power (292,124 horsepower), of water power (60,510 horsepower), and of power generated by gas and other internal-combustion engines (1,736 horsepower), were reported for the state of Massachusetts. The largest amount of rented electric power, 43,239 horsepower, or nearly two-fifths of the total for the United States, was reported for North Carolina, with South Carolina following closely. In North Carolina over one-fourth of the total primary power was rented electric power and in South Carolina nearly one-fifth.

² Not reported.

Fuel consumed.—Although a large proportion of the power used in this industry is either water power or rented electric power, the amount of fuel consumed is very large. Bituminous coal is the principal class of fuel used, 3,327,802 short tons being consumed in 1909. Massachusetts reported the largest quantity, 918,635 tons, or over one-fourth of the entire amount used in the industry. This state also reported the largest

quantity of anthracite coal—166,788 long tons, or practically two-fifths of the total for the United States. Only three states, North Carolina, New Hampshire, and Georgia, used coke to any extent, the state first named using nearly one-half of that reported for the entire United States. The largest amount of oil (15,981 barrels) was reported for Texas, and the largest quantity of gas (210,360,000 cubic feet), for Illinois.

SPECIAL STATISTICS RELATING TO MATERIALS, PRODUCTS, EQUIPMENT, ETC.

MATERIALS.

Summary for the United States.—Table 18 gives statistics of the chief materials used in the industry as a whole for 1909, 1904, and 1899.

Table 18	COTTON GOODS, INCLUDING COTTON SMALL . WARES.								
MATERIAL.	1909	1904	1899

	\$2, 114, 756	\$1, 506, 804	\$1,227,01						
Chemicals and dyestuffsAll other materials	\$4,886,514	\$4,573,375	\$5,718,10						
	\$50,673,409	\$29,536,885	\$25,298,63						

The total cost of materials as reported for 1909, which, however, includes a considerable amount of duplication, was \$371,009,470, an increase of \$84,754,-167, or 29.6 per cent, over 1904, and of \$194,457,943, or 110.1 per cent, over 1899. Raw cotton is by far the most important material, the next in importance being cotton varn, most of which is purchased from other mills in the industry, and is thus an important element in the duplication of value of products. The amount of cotton used by establishments in this industry increased from 1,817,643,390 pounds in 1899 to 2,335,344,906 pounds in 1909, or 28.5 per cent, and its cost from \$125,169,616 to \$274,724,210, or 119.5 per cent. The domestic cotton consumed increased 28.2 per cent in quantity and 119.6 per cent in value from 1899 to 1909, while foreign cotton increased 36.1 per cent in quantity and 117 per cent in value during the same period. Foreign cotton constituted 3.3 per cent of the total quantity in 1909 and 3.1 per cent in 1899.

A large amount of cotton is consumed in industries other than that designated "cotton goods, including cotton small wares." The total consumption of cotton by all manufacturing industries in the United States

for the year ending August 31, 1909, was, according to the annual report of the Census Bureau on the supply and distribution of cotton, 5,198,963 equivalent 500-pound bales, comprising 5,037,225 bales of domestic cotton, round bales being counted as half bales, and 161,738 bales of foreign cotton. The consumption reported by the cotton manufacturing industry (comprising cotton goods and cotton small wares) for the calendar year 1909 was equal to 92.9 per cent of the total consumption of domestic cotton above mentioned and to 94 per cent of the total consumption of the foreign cotton. The foreign cotton consumed is chiefly Egyptian, which is used largely in the manufacture of thread, knit goods, and machine lace, although some Peruvian cotton is used as a substitute for wool in the manufacture of woolen goods. and also some Chinese and Indian cotton.

Materials used, by states.—Table 19 gives, by states, the consumption of materials for the years 1909, 1904. and 1899, with the cost for 1909.

The comparative cost of cotton per pound in the different states is rather interesting. The average (domestic) for the whole country is about 11.6 cents. It is highest for New Jersey, owing to the character of its principal product—sewing thread—more than 14 cents. It is also higher in Massachusetts (12.9 cents) and Rhode Island (12.9 cents) because of the use of longer staple cotton in the manufacture of fine goods.

Foreign cotton constitutes but a very small proportion of the cotton consumed in the industry, and the use of such cotton is chiefly confined to a few states. In 1909 Massachusetts alone consumed 57.9 per cent

of the total, and the New England states together, exclusive of Maine, about five-sixths of the total. In Massachusetts foreign cotton represented 7.1 per cent of all the cotton consumed, while in New Jersey, where the proportion was highest, it represented 35.8 per cent of the total.

In addition to raw cotton, the mills reported the consumption of small quantities of cotton which had been dyed, bleached, or otherwise treated by other establishments, and also of 257,102 pounds of raw silk and 1,370,087 pounds of other fibers—flax, wool, jute, ramie, mohair, etc.-more than four-fifths of this latter amount being flax.

Not reported.
 Consumption by cotton small wares branch of the industry included under "all other states."
 Included in totals, but amount not shown, to avoid disclosure of individual operations.

Some cotton mills confine themselves to spinning. selling the yarn to other mills for weaving, while others do weaving only, or spin only part of the varn they weave. The state of Pennsylvania is the largest user of purchased cotton yarn, reporting 36.9 per cent of the total quantity purchased by all mills in the industry in 1909, 39.1 per cent in 1904, and 42.2 per cent in 1899. Much of this yarn is of course made in other states. The cost of the purchased yarn used by the Pennsylvania mills in 1909 was nearly four times as great as that of the raw cotton used by them, while in no other state except New Jersey did the cost of yarn purchased equal that of raw cotton. Massachusetts, the second state in the use of this material, reported 27,175,076 pounds of purchased cotton yarn in 1909, or 21.4 per cent of the total. Rhode Island, New Jersey, and North Carolina were the states next in importance.

The consumption of silk yarn (organzine and tram) and spun silk yarn shows large gains, the total quantity of the two combined reported for 1909 being nearly four times the quantity used in the cotton manufacturing industry in 1899. Massachusetts reported more than half of the total quantity in

The mills in Rhode Island used 36.5 per cent of the entire amount of cotton waste reported for 1909 and 58.9 per cent of that reported for 1904, Massachusetts, Georgia, and North Carolina, in the order named, being the next largest users in 1909.

The cost of chemicals and dyestuffs, as reported at the census of 1909, was \$4,886,514, as compared with \$5,718,107 in 1899. The figures, however, do not cover the total cost of these materials, as in some cases their cost was not reported separately.

Consumption of cotton, by states.—Table 20 shows the consumption of foreign and domestic cotton in the industry designated "cotton goods, including cotton small wares" for the census years 1909, 1904, 1899, and 1889 (the reports of most establishments being for the calendar years). It shows also the total consumption of cotton in the two branches of the industry, in certain groups of states, and in the most important individual states.

¹ The figure given for sea-island cotton represents the total consumption in all industries during the year ending August 31, 1909, and that for "other than sea island" is obtained by subtracting this figure from the total for domestic cotton.

² Not reported separately.

³ Included under "all other states."

⁴ Included under "all other states."

The consumption of sea-island cotton in 1909 was not reported separately in connection with the census of manufactures, but the total consumption in the United States for the year ending August 31, 1909, was 67,749 bales, and presumably about the same amount was used during the year covered by the census of manufactures. Practically all of this kind of cotton was used in the manufacture of thread, lace, and other goods where strength and fineness are indispensable.

One of the most important points brought out by the table is the marked increase in cotton consumption in the cotton-growing states and the consequent

Included under "all other states."
 Included the following:
 1809—Arkansas, Delaware, Illinois, Indiana, Kansas, Kentucky, Louisiana, Missouri, Vermont, and Wisconsin.
 1904—Arkansas, California, Delaware, Illinois, Indiana, Kentucky, Louisiana, Missouri, Vermont, and Wisconsin.
 1899—Arkansas, California, Colorado, Delaware, Illinois, Indiana, Kentucky, Louisiana, Missouri, Nebraska, Vermont, West Virginia, and Wisconsin.
 1889—Arkansas, California, Delaware, Illinois, Indiana, Iowa, Kentucky, Louisiana, Missouri, Ohio, Texas, Vermont, and Wisconsin.

decrease in the relative importance of the older manufacturing sections. In 1889 the New England states reported 63.9 per cent of the total cotton consumption for the industry, but the proportion had decreased to 51.8 per cent in 1899, to 45.1 per cent in 1904, and to 43.5 per cent in 1909. In like manner the proportion for all states other than the New England states and the cotton growing states, which was 13.6 per cent in 1889, decreased to 9.3 per cent in 1899, to 7.4 per cent in 1904, and to 6.7 per cent in 1909. On the other hand, the cotton growing states, which comprise Virginia, Kentucky, Missouri, Kansas, Oklahoma, and the states south, reported 22.4 per cent of the total consumption in 1889, 38.9 per cent in 1899, 47.5 per cent in 1904, and 49.8 per cent in 1909.

The percentage of increase in the amount of cotton consumed in the cotton-growing states was 182.2 per cent for the decade 1889–1899 and 64.3 per cent for the decade 1899–1909. For the New England states the corresponding increases were 31.7 per cent and 7.9 per cent, respectively, while the consumption by all the remaining states taken as a group increased 10.8 per cent during the former period, but decreased 6.8 per cent during the latter. For the New England states the actual increase in cotton consumption during the decade 1899–1909 was about 74,000,000 pounds. For the separate states the largest actual increase, about 160,000,000 pounds, is shown for North Carolina, but

Virginia shows the highest rate of increase among the states shown separately in Table 20—108.4 per cent.

Massachusetts was in 1909, as it had been in prior census years, the largest consumer of cotton, 1,244,614 bales, or 622,368,027 pounds, being used in the cotton manufacturing industry of the state during the year. This amount was 27 per cent greater than that reported in 1904. By reason of labor troubles, the year 1904 was one of low consumption of cotton in Fall River—the most important cotton manufacturing city in the country-and this accounted for the decrease in Massachusetts for the five-year period 1899-1904. For the decade 1899-1909 Massachusetts showed a gain of 10.9 per cent. North Carolina was the next largest user of cotton in 1909, having displaced South Carolina, which held second place in 1904 and 1899. The increase in consumption in this state from 1899 to 1909 was 84.2 per cent. South Carolina was third, Georgia fourth, and New Hampshire fifth in order in 1909, their consumption of cotton having increased during the decade 41 per cent, 72 per cent, and 1.1 per cent. respectively. PRODUCTS.

Summary for the United States.—Table 21 gives in detail for the United States the quantity and value of the various products reported by establishments in the cotton manufacturing industry for 1909, 1904, and 1899.

Table 21	COTTON GOOD	s, including c wares.	OTTON SMALL	≯RODUCT.	COTTON GOODS	, including co Wares.	OTTON SMALL

¹ In addition, cotton goods to the value of \$2,224,096 were made by establishments engaged primarily in the manufacture of products other than cotton goods.

Not reported separately.

The total value of all products reported by establishments in the industry designated "cotton goods, including cotton small wares," in 1909 was \$628,391,-

813, a gain of \$177,924,109, or 39.5 per cent, over 1904, and \$289,191,493, or 85.3 per cent, over 1899. The total value includes, as already stated, much duplica-

COTTON. 51

tion, and the increase shown is due in part to the higher prices prevailing in 1909. The total number of square vards of fabrics woven by establishments in the industry increased 24.2 per cent between 1904 and 1909 and 40.3 per cent between 1899 and 1909. The value of woven goods in 1909 represented a little less than threefourths of the total value of all products.

Plain cloths for printing or converting comprise by far the most important class of woven goods, as measured by quantity, constituting, in 1909, 35 per cent of the total. Brown and bleached sheetings and shirtings ranked second, followed by ginghams, fancy woven fabrics, twills and sateens, and napped fabrics. in the order named, the production of each of these classes of cloths being more than 300,000,000 square yards in 1909.

The output of plain cloths for printing or converting increased 40.7 per cent between 1899 and 1909, and its value 92.3 per cent. The output of sheetings and shirtings increased 22.4 per cent, and their value 60 per cent. For these, as for practically all the other classes of products, the percentage of increase in value was much greater than that in quantity. The decrease in the production of sheetings and shirtings between 1899 and 1904 was largely attributable to the prolonged labor disturbances in the cotton mills of Massachusetts in the latter year.

With one exception—napped fabrics—all classes of woven goods show an increase in quantity of output from 1904 to 1909, although the output of several classes was less in 1904 than in 1899, and that of two classes—cottonades and "other" upholstering goods was less in 1909 than in 1899. The highest relative increase during the decade was in corduroy, cotton velvet, and plush, the production of which in 1909 was 147.5 per cent greater than in 1899, and the value 159.7 per cent greater. The production of ginghams increased 93 per cent during the decade, that of upholstering goods 84.8 per cent, and that of fancy woven fabrics 79.4 per cent. The quantity of duck woven increased 25.7 per cent between 1899 and 1909, and the value increased 92.7 per cent. The total production of duck in 1909 included 8,658,111 square yards of sailcloth, valued at \$1,710,631, as compared with 9,586,519 square yards, valued at \$1,540,745, in 1904, and 11,750,151 square yards, valued at \$2,216,-371, in 1899—the decrease for sailcloth during the decade being 26.3 per cent in quantity and 22.8 per cent in value.

The most important products of the industry, other than woven fabrics, are yarns, thread, and cotton waste. The value of the yarns made for sale as such in 1909 was \$109,314,953, or more than one-sixth of the total value of products of the industry. A considerable part of this yarn was sold to other establishments in the same industry. The quantity of yarn reported as produced for sale in 1909 was 470,370,995 pounds, while the quantity of yarn reported as purchased by cotton mills was 126,707,003 pounds. Much

of the yarn made by the cotton mills is sold to hosiery and knit goods factories, the consumption of purchased cotton yarn by such factories in 1909 being 216,987,611 pounds, and some is sold to factories in still other textile industries. The quantity of yarn reported as manufactured for sale increased 138,068,374 pounds. or 41.5 per cent, during the decade, while the value increased 98 per cent. The amount of thread manufactured increased 49 per cent, and its value 72.3 per

In addition to the products shown in Table 21 for cotton manufacturing industry, cotton manufactures of similar character to the value of \$2,224,096 were reported for 1909 by establishments engaged primarily in other industries. On the other hand, the total value of products reported for 1909 for the cotton manufacturing industry proper covered products other than cotton goods and cotton small wares to the value of \$7,688,866.

Table 22 shows the total value of all cotton manufactures, and the total quantity and value of certain specific classes of goods, including all of those which were reported as secondary products by establishments engaged primarily in industries other than cotton manufacturing, except that the total production of cotton twine and cotton cordage and rope is shown in Table 23. The quantities and values of the cotton goods and cotton small wares produced by establishments in other industries, which are included in Table 22, do not enter into the statistics presented in any subsequent tables.

¹ Includes products manufactured primarily in the following industries: Bags, other than paper; carpets and rugs, other than rag; cordage and twine and jute and linen goods; dyeing and finishing textiles; foundry and machine-shop products; furnishing goods, men's; gas, illuminating and heating; hammecks; hosiery and knit goods; house-furnishing goods; ice, manufactured; mattresses and spring beds; millinery and lace goods; shoddy; silk and silk goods, including throwsters; woolen, worsted, and felt goods, and wool hats.
¹ Includes products made by establishments in the following industries: Carpets and rugs, other than rag; clothing, men's, including shirts; cordage and twine and jute and linen goods; furnishing goods, men's; gas and electric fixtures and lampand reflectors; haircloth; oil, castor; patent medicines and compounds and druggists' preparations; rubber goods, not elsewhere specified; upholstering materials; woolen, worsted, and felt goods, and wool hats.

Cordage and twine are the most important of the secondary products of the cotton manufacturing industry, cotton twine and cotton cordage and rope to the amount of 21,319,678 pounds having been reported for 1909 by establishments engaged primarily in this industry. The value of these products, \$3,581,917, constituted almost half of the value of "products other than cotton goods and cotton small wares" reported by the cotton mills, and more than one-third of the total value of cotton twine and cotton cordage and rope reported by establishments in all industries together. The total quantity of these products reported for 1909 was 58,493,072 pounds, and the total value was \$10,111,566, most of the production outside the cotton mills being reported by establishments in the industry designated "cordage and twine and jute and linen goods." The total output and value of the cotton twine and the cotton cordage and rope produced in 1909 are shown, by states, in Table 23.

1 Figures not available

2 Excluding statistics for one establishment, to avoid disclosure of individual operations.
3 In addition, 20,412,631 pounds, valued at \$3,518,036, were made by establishments manufacturing cotton cordage and twine as primary products.
4 In addition, 16,760,763 pounds, valued at \$3,011,613, were made by establishments manufacturing cotton cordage and twine as primary products.

Massachusetts, the most important state in the industry as a whole, produced 47.4 per cent of the total output of plain cloths for printing or converting in 1909, as compared with 58.6 per cent in 1899. South Carolina ranked second, with 25.3 per cent of the total quantity in 1909 and 11.1 per cent in 1899, followed by Rhode Island, North Carolina, New York, and Connecticut.

South Carolina was the largest producer of sheetings and shirtings, reporting 20.4 per cent of the total output in 1909 and 23.4 per cent in 1899. Georgia ranked second in this respect, and Massachusetts third (though the latter state ranked second on the basis of value), while North Carolina and Rhode Island were fourth and fifth. The average value per yard of the sheetings and shirtings manufactured in North Carolina was \$0.0503, in South Carolina \$0.0526. in Georgia \$0.0533, in Massachusetts \$0.0653, and in Rhode Island \$0.0755.

Twills and sateens, whose manufacture involves fine spinning and complicated weaving, are produced for the most part in the Northern states. Massachusetts reported 41.1 per cent of the total quantity of these goods in 1909 and Rhode Island 13.9 per cent. The proportions reported by these states in 1899 were 36.7 per cent and 18.4 per cent, respectively.

Of the total production of fancy woven fabrics, Massachusetts reported 46.3 per cent in 1909 and 57.6 per cent in 1899. The table shows a large increase in the manufacture of this class of goods in the Southern states, Georgia, North Carolina, and South Carolina reporting a combined production of over 100,000,000 square yards in 1909, as compared with less than 10,000,000 in 1899.

Of the total output of ginghams, Massachusetts produced 26 per cent and North Carolina 20.8 per cent in 1909, as compared with 19.4 and 28.6 per cent, respectively, in 1899.

Of the total quantity of duck woven, Georgia furnished 30.5 per cent in 1909, and Massachusetts 18 per cent, the corresponding proportions in 1899 being 24.5 per cent and 13.9 per cent, respectively.

South Carolina and Georgia, with 31.7 per cent and 26.8 per cent of the total, respectively, were the leading states in the production of drills in 1909. The former state, however, shows a smaller percentage of the total production for 1909 than for 1899. North Carolina and Massachusetts were the leading states in the production of ticks, denims, and stripes, the former reporting 37 per cent and the latter 22.2 per cent of the total production for the year 1909, as compared with 12.8 per cent and 35.1 per cent, respectively, for 1899. Of cottonades, Georgia reported the largest production in 1909 and 1904, and Pennsylvania in 1899. Massachusetts, New Hampshire, and North Carolina were the leading states in the manufacture of napped fabrics at all three censuses.

The state of Pennsylvania produces the great bulk of the tapestries manufactured in the United States, as well as of the lace and lace curtains. Chenille curtains were reported from Pennsylvania and New

Of the total production of bags and bagging, in 1909, South Carolina reported 19,792,444 square yards,

or 31.4 per cent while Maine contributed 15.1 per cent The production of tape and webbing was confined almost exclusively to Pennsylvania, Rhode Island, and Massachusetts.

Though the state of North Carolina spun more pounds of yarn for sale in 1904 and 1909 than any other state, the value in 1909 was less than that of the varns produced in Massachusetts. The average reported value per pound of the yarn produced in the former state was 19.4 cents in 1904 and 19.9 cents in 1909, as compared with 25.6 cents and 29.1 cents. respectively, in the latter state.

In production of thread or sewing cotton, Massachusetts, New Jersey, Connecticut, and Rhode Island were the leading states.

Production of yarns.—Table 25 gives, by states, for 1909, 1904, and 1899, the production of cotton varn. classified according to grade or fineness. Yarns made for use in further manufacture in the same establishments are included, as well as yarns made for sale.

i Includes Arkansas.

The increase in the total amount of varn made in the establishments of the cotton manufacturing industry from 1904 to 1909 was 33.2 per cent; from 1899 to 1904, 4.2 per cent; and for the decade 1899-1909, 38.8 per cent. Each of the three grades of varn for which statistics are presented shows a considerable increase for the decade, but there has been considerable variation from census to census in the proportions which the several grades formed of the total production.

Table 26 shows, in percentages, the distribution of the yarn production, by grades, for the census years from 1889 to 1909.

Table 26 GRADE OR SIZE.	PER CENT OF TOTAL YARN PRODUCT THE COTTON MANUFACTURING INDU					
	1909	1904	1899	1889		
Coarse (No. 20 and under)	49. 8 42. 5 7. 7	52. 6 39. 4 8. 1	57. 9 36. 8 5. 3	53. 42, 9 42, 9 3, 9		

This table shows that, in the country as a whole, coarse yarn formed a considerably smaller proportion of the total production in 1909 than in 1899, and both medium and fine yarns a considerably larger proportion.

² Includes Delaware.

³ Includes States as follows: For 1909, Illinois, Kansas, Missouri, and Wisconsin; for 1904, California, Illinois, Missouri, and Wisconsin; and for 1899, California Illinois, Missouri, and Wisconsin.

COTTON. 55

The New England states reported nearly three-fourths of all the fine yarn produced in 1909, Massachusetts alone reporting 41.5 per cent of the total. Rhode Island ranked second in the production of fine yarn, North Carolina third, and Connecticut fourth. The total quantity reported in 1909 was 103.7 per cent greater than in 1899. The rapid increase in the production of yarn of this grade in North Carolina and some of the other Southern states is noteworthy.

The production of medium yarn (No. 21 to No. 40) shows an increase of 60.4 per cent for the decade 1899–1909. Massachusetts led in the production of this grade as well as of fine yarn, reporting nearly one-third of the total for the United States in 1909. South Carolina ranked second, North Carolina third, and Rhode Island fourth, these four states together furnishing about seven-tenths of the total quantity reported.

The output of coarse yarn (No. 20 and under) increased 26.2 per cent between 1904 and 1909, but a decrease took place during the five-year period 1899–1904, and the net increase for the decade was only 19.3 per cent. Georgia led in the amount of coarse yarn spun in 1909, with North Carolina second, Massachusetts third, and South Carolina fourth.

EQUIPMENT.

Spindles.—Although the number of spindles reported is not a strictly accurate index of the growth of the cotton industry, because of their different speeds and their use upon different grades of yarn, it is one of the best standards available and is the most generally accepted measure of progress. "Producing" spindles are those which are used in the production of yarn as distinguished from "doubling" and "twisting" spindles, which, as the name implies, twist two or more yarns together into a single strand. A spindle is termed "active" if it has been in operation at any time during the census year.

Table 27 gives, by geographic divisions, for 1909, 1904, and 1899, the number of active producing spindles in the cotton mills, exclusive of mills in the cotton small wares branch of the industry.

Table 27	ACTIVE PRODUCING SPINDLES IN COTTON MILLS.

 $^{^1}$ Not including mills in the cotton small wares branch of the industry. 2 A minus sign (—) denotes decrease.

The New England division reported 56.2 per cent of the entire number of active producing spindles in the cotton mills of the United States in 1909, as compared with 67.6 per cent in 1899, showing a considerable decrease in relative importance in this respect, notwithstanding an increase of 19.7 per cent in the total number of producing spindles during the decade. The South Atlantic division reported 32.4 per cent of the total number of active producing spindles in 1909 and 19.4 per cent in 1899 the increase during the decade being 139.9 per cent. The numerical gain in the South Atlantic division during the decade was 5,171,980, as compared with 2,532,922 in the New England division. The number of active producing spindles in the East South Central division increased 97.7 per cent from 1899 to 1909, but in the Middle Atlantic division the number in 1909 was slightly less than that in 1899.

Table 28 shows the number of active producing cotton spindles in the several textile industries, by geographic divisions and states, for 1909 and 1899, with the total for all textile industries for 1889 also.

The total number of cotton spindles in the principal textile industries in 1909 was 28,178,862, of which 27,425,608 were in the cotton mills, including a comparatively small number in mills making cotton small wares. The increase in the number of spindles from 1889 to 1899 was 5,079,804, or 35.3 per cent, and from 1899 to 1909, 8,714,878, or 44.8 per cent. The greatest percentage of increase in any industry from 1899 to 1909 was in the hosiery and knit-goods industry—134.8 per cent. A decrease is shown in the number of cotton spindles in the woolen and worsted mills and the carpet and rug factories combined.

Eight states-Georgia, the two Carolinas, and all the New England states except Vermont—reported over 1,000,000 active producing spindles in 1909. Massachusetts, the leading state, with 9,637,601 spindles. shows a gain of 1,705,930, or 21.5 per cent, for the 10year period 1899-1909. South Carolina reported the greatest absolute and relative increase during the decade, the gain being 2,323,922 spindles, or 161.7 per cent. In North Carolina the increase was 1,820,907 spindles, or 160.1 per cent. The percentages of gain for the decade for the other states which reported a million or more spindles in 1909 are as follows: Georgia, 113.3 per cent; Maine, 21.3 per cent; Connecticut and Rhode Island, 20.3 per cent each, and New Hampshire. 6.1 per cent. Six states shown in the table reported fewer spindles in 1909 than in 1899, namely, Delaware, Maryland, New Jersey, Pennsylvania, Vermont, and Wisconsin.

Of the total number of cotton spindles in the hosiery and knit-goods industry, 195,089, or 40.4 per cent, were reported from the Middle Atlantic states, most of these being in the state of New York.

¹ Including mills in the cotton small wares branch of the industry.

Table 29 shows the number of active producing ring and mule spindles in cotton mills, by states, for the years 1909, 1904, 1899, and 1889. It does not include

spindles in establishments engaged in the cotton small wares branch of the industry except for the year 1889.

Includes mills in the cotton small wares branch of the industry.

While the number of ring spindles has increased rapidly from census to census, the number of mule spindles

1889 mule spindles formed 37.8 per cent of the total; in 1899, 29.3 per cent; in 1904, 22.6 per cent; and in reported decreased steadily from 1899 to 1909. In | 1909, only 17.2 per cent. Most of the individual states show decreases in the number of mule spindles reported for 1909, as compared with the number in 1899.

The use of mule spindles is confined chiefly to the Northern states. In 1909 the number in Massachusetts, 2,090,211, represented more than two-fifths of the total number of mule spindles in the United States and more than one-fifth of the total number of all spindles in that state. The proportion of mule spindles, however, was considerably higher in some of the other states, including Connecticut, New Jersey. New York, Pennsylvania, and Rhode Island, about threefourths of the spindles in New Jersey in 1909 being mule spindles. Apparently, however, the purchase and installation of mule spindles have practically ceased. for in the states where most of the cotton mills are comparatively new the number of mule spindles is relatively insignificant. In South Carolina, which has more spindles than any other state except Massachusetts, mule spindles constituted in 1909 less than 1 per cent of the total number of spindles.

In addition to the active spindles reported there were 523,911 idle "producing" spindles in active cotton mills in 1909, statistics for which are given in Table 30.

In addition to the active producing cotton spindles, the cotton mills reported, in 1909, 2,061,603 doubling and twisting spindles, and 5,044 producing spindles using fibers other than cotton. Table 31 shows the doubling and twisting spindles distributed by geographic divisions and states.

Table 31 DIVISION AND STATE.	Doubling and twisting spindles in the cotton manufacturing industry: 1909	DIVISION AND STATE.	Doubling and twisting spindles in the cotton manufacturing industry: 1909

Looms.—Table 32 gives, by geographic divisions, for 1909, 1904, and 1899, the total number of looms employed in the cotton mills (exclusive of the mills in the cotton small wares branch of the industry), classified according to the character of the fabrics on which used.

Of the total number of looms in 1909, 74.8 per cent were employed on plain cloths, 12.4 per cent on twills and sateens, 11.8 per cent on fancy weaves, and only 1 per cent on all other fabrics.

The total number of looms increased 182,281, or 40.4 per cent, during the decade. The rate of increase in the number of looms in each five-year period was a little lower than that in the number of spindles. The greatest increase for the decade in any geographic division was 96,879, or 101.3 per cent, in the South Atlantic division. The New England division shows an increase of 74,675, or 25 per cent, the Middle Atlantic a slight decrease, and the East South Central an increase of 11,343, or 75.6 per cent.

Of the several classes of looms employed on the different widths of plain cloth, the one showing the greatest percentage of gain is that comprising looms over 36 inches wide, which increased 59 per cent in number during the decade 1899–1909, as compared with an increase of only 39.2 per cent in the total number of looms used on plain cloth. This means that the capacity of the looms employed on plain cloth increased more rapidly than their total number.

The number of looms on twills and sateens increased 19,453, or 33.1 per cent, most of this gain having been in the New England states. An actual loss was reported by the Middle Atlantic division. The number of looms on fancy weaves increased 29,204, or 63.9 per

cent. The largest absolute gain in number of looms reported was in the New England states, but the relative increase in these states was less than that in the South Atlantic division, which amounted to 256.9 per cent.

1 Not including mills in the cotton small wares branch of the industry.
2 In addition, establishments engaged primarily in the manufacture of products other than cotton goods reported cotton looms as follows:

 Total number
 540

 On plain cloths
 85

 28 to 32 inches wide
 19

 36 inches wide and over
 68

 On twills and sateens
 40

 On fancy weaves
 415

Includes the following states, with establishments as indicated: For 1909, Kansas, 1, and Missouri, 2; for 1904, California, 1, and Missouri, 1; for 1899, Arkansas, 2; California, 1; Colorado, 1; Illinois, 1; Louisiana, 2; Missouri, 2; Nebraska, 1; and West Virginia, 1.

Relation of spindles and looms to wage earners and cotton consumption.—Table 33 shows the average number of wage earners in cotton mills (including the mills in the cotton small wares branch of the industry), the amount of wages paid, the total number of active producing spindles, the number of such spindles per wage earner, and the amount of wages paid per spindle, for each census year from 1879 to 1909.

Table 33	COTTON GOODS, INCLUDING COTTON SMALL WARES.								
YEAR.	Wage earners (average number).	Wages.	Number of active producing spindles.	Number of spindles per wage earner.	Wages per spindle.				
1909	378, 880 315, 874 302, 861 218, 876 172, 544	\$132, 859, 145 96, 205, 796 86, 689, 752 66, 024, 538 42, 040, 510	27, 425, 608 23, 195, 143 19, 050, 952 14, 188, 103 10, 653, 435	72,39 73,43 62,90 64,82 61,74	\$4.84 4.18 4.58 4.68 3.98				

While there is little necessary relation between the number of spindles in a single establishment, or even in a single state or division, and the number of wage earners employed, by reason of variations in the character of the products turned out, the grade of

labor employed, and other factors which would affect either the proportion of spinners in the total number of wage earners or the nominal efficiency of the labor, the average number of spindles per wage earner for the United States as a whole is not without significance. It shows the relation, at least, between two statistical elements which are widely used as standards for measuring the growth of industries; and the industry as a whole is not subject to the rapid and radical changes which sometimes affect the mills of a limited section. Temporary labor troubles in New England in 1904 somewhat reduced the average number of wage earners without making any corresponding reduction in the number of spindles reported, thus rendering the average number of spindles per wage earner for that year somewhat higher than it would otherwise have been; but this case is exceptional. Increasing rates of wages must be taken into account, of course, in considering the wage cost per spindle, and also the fact that salaries were to some extent included with wages at the earlier censuses.

Of somewhat more significance, perhaps, than the figures given in the preceding table, are statistics

showing the average number of spindles per spinner and the average number of looms per weaver. Such statistics are presented in Table 34.

Table 34	COTTON INCLUDING SMALL	COTTÓN
STATE.	Average number of spindles per spinner.	Average number of looms per weaver.
United States: 1909. 1904.	407 384	6.5 5.5
Leading states, 1909: New England— Massachusetts. New Hampshire. Rhodo Island Southern—	718 553 582	6.9 8.8 7.6
Alabama Georgia North Carolina South Carolina	245 219 228 297	5.7 5.8 5.4 7.5

The several states differ greatly in the number of spindles per spinner, the figures for the Southern states being very much lower than those for the New England states. These differences are doubtless mainly attributable to differences in the efficiency of labor, to the fact that relatively more children are employed as spinners in the South than in the North, and to differences in the grade of yarn made. The difference between the South and the North with respect to the number of looms per weaver is less conspicuous; in fact, the average number of looms per weaver was higher in South Carolina than in Massachusetts.

Table 35 shows the amount of cotton used per spindle in the United States during each census year from 1879 to 1909, and in the leading states during

Table 35	Cotton consumed per spindle in the cotton manufacturing industry (pounds).
United States: 1909 1004 1899 1889 1889 1879 Leading states, 1909: New England— Massachusetts. New Hampshire Rhode Island Southern— Alabama Georgia. North Carolina South Carolina	95. 41 78. 79 70. 43 - 66. 39 - 105. 03 - 47. 70 - 131. 22 - 143. 37 - 120. 41

The consumption of cotton per spindle in the country as a whole was considerably greater in 1909 than in 1879, though much less than in 1899. The changes are doubtless due in large measure to the increasing importance of the Southern states in cotton manufacturing and to changing conditions in the South. The consumption of cotton per spindle was lower in the New England states than in the Southern states, which is partly attributable to differences in the grade of yarn made.

Dyeing and finishing and contract work.—Table 36 shows, by states, the number of establishments bleaching, dyeing, or printing their own products in 1909, the number performing these processes for others, and the number doing custom spinning or weaving.

Of the 1,324 establishments in the cotton manufacturing industry in 1909, 315 reported that they bleached, dyed, or printed their own goods, 27 that they performed these processes for others as well as upon their own products, and 19 that they did custom spinning or weaving. Of the other establishments, some made only products requiring no bleaching, dyeing, or printing, while others had the work done under contract, either by other establishments in the industry or by establishments in other industries, particularly in the industry designated "dyeing and finishing textiles."

The total expenditure of the cotton mills for contract work of all kinds in 1909 was \$2,157,069. This expenditure is distributed, by states, in Table 46.

SPECIAL STATISTICS FOR THE COTTON SMALL WARES BRANCH OF THE INDUSTRY.

Table 37 summarizes the statistics of the cotton small wares branch of the industry for 1909, 1904, and 1899.

1 A minus sign (-) denotes decrease.

A considerable number of establishments which use cotton or cotton yarn as their chief material do not

make piece goods, but confine their operations mainly to the manufacture of narrow fabrics, such as braids, tapes, binding, shoe laces, and corset laces, incidentally spinning small quantities of yarn for sale.

These establishments constitute the cotton small wares branch of the cotton manufacturing industry. Except as otherwise noted, the data relating to these establishments have been included with those for the other cotton mills in the statistics heretofore presented, but they are shown separately for 1909, 1904, and 1899 in Table 37. It should be borne in mind that large quantities of cotton small wares are also manufactured by establishments making piece goods as well.

From 1899 to 1904 the number of establishments in the cotton small wares branch of the industry decreased from 82 to 77, but in 1909 these establishments numbered 116. The average number of wage earners increased 56.1 per cent during the decade, and the value of products increased 106 per cent during the same period.

Summary, by states.—Table 38 summarizes, by states, the important statistics relating to the cotton small wares branch of the cotton manufacturing industry for 1909, 1904, and 1899.

COTTON SMALL WARES-COMPARATIVE STATISTICS, BY STATES: 1909, 1904, AND 1899.

1 Included under "all other states."

In 1909 the largest number of establishments was reported for Pennsylvania, with Rhode Island ranking next, but in value of products the latter state ranked first. Three states show a very considerable increase in value of products between 1899 and 1909, namely,

Massachusetts (164.5 per cent), Rhode Island (118.1 per cent), and Pennsylvania (108.9 per cent).

Materials.—Table 39 shows statistics of the materials used by establishments in the cotton small wares branch of the industry for 1909, 1904, and 1899.

Table 39	MATERIALS US WARES BRA	BED IN THE COT	TON SMALL DUSTRY.

All other materials	\$1,065,060	\$518,840	\$495,986

The total cost of materials used increased from \$3,110,137 in 1899 to \$4,207,655 in 1904 and to \$6,995,966 in 1909, an increase of 124.9 per cent for the decade. The most important of the materials is cotton yarn purchased as such, the consumption of which increased from 10,860,648 pounds in 1899 to 18,346,525 pounds in 1909, or 68.9 per cent. During the same period the cost increased 151 per cent, forming 60.2 per cent of the total cost of materials in 1899 and 67.2 per cent in 1909. The consumption of silk yarn and spun silk yarn also increased greatly from 1899 to 1909, but the quantity of raw cotton used shows a steady decrease for the decade.

Products.—Table 40 gives, so far as possible without the disclosure of individual operations, the quantity and value of the principal products of the cotton small wares branch of the cotton manufacturing industry for 1909, 1904, and 1899. It shows also the total quantity of yarn spun (including that used in further processes of manufacture), classified according to degree of fineness.

¹ Not reported. ² Including that used in the further processes of manufacture.

The value of tape and webbing constituted 40.5 per cent of the total value of products in 1909 and 34.3 per cent in 1899. The total quantity of yarn spun increased from 2,410,268 pounds in 1904 to 2,637,021 pounds in 1909, or 9.4 per cent, the quantity of coarse yarn made in 1909 being more than three times as great as in 1904, while the quantity of medium yarn decreased 30.7 per cent. No fine yarn was reported for 1904 and only a small quantity for 1909.

Spindles and looms.—Table 41 shows the number of spindles and of looms (including braiders) employed in the cotton small wares branch of the cotton manufacturing industry in 1909, 1904, and 1899, for the United States and for selected states.

Table 41		COTTON SM BRANCH INDUS	
STATE.	Census.	Spindles.	Looms (includ- ing braiders).
United States	1909 1904 1899	29, 808 39, 530 42, 600	32,086 18,386 5,070
Massachusetts	1909 1904 1899	2,640	5,501 5,506 302
Pennsylvania	1909 1904 1899	112 250	5,275 3,167 1,684
Rhode Island	1909 1904 1899	25,000 36,280 39,900	18,492 8,288 2,826
All other states	1909 1904 1899	2,056 3,000 2,700	2,818 1,425 258

The total number of spindles in 1909 was 29,808, as compared with 42,600 in 1899, a decrease of 30 per cent during the decade. Rhode Island reported 25,000 spindles in 1909, or 83.9 per cent of the total. The exceedingly small number of spindles reported by Pennsylvania is worthy of note, as indicating the use of purchased yarns in most of the cotton small wares mills of that state. While there was a considerable decrease during the decade in the total number of spindles reported, a great gain is shown in the number of looms and braiders, which was 32,086 in 1909; of this number, 26,382 were braiders. Of the total number of looms and braiders reported for 1909. 57.6 per cent were in Rhode Island. Of the 26,382 braiders in 1909, Rhode Island reported 16,871, Massachusetts 4,905, Pennsylvania 2,130, and all other states 2,476.

The spinning of the yarn has apparently become less and less a factor in this branch of the industry, the manufacturers preferring to buy the yarn of other establishments.

IMPORTS AND EXPORTS OF COTTON AND COTTON GOODS.

Table 42 shows, for each census year from 1850 to | duction, net imports, consumption, and exports of 1900, and for each year from 1905 to 1909, the pro- raw cotton.

DETAILED STATE TABLES.

The principal statistics secured concerning the cotton manufacturing industry as a whole are presented, by states, in Tables 45 and 46.

Table 45 shows, for 1909, 1904, and 1899, the number of establishments, number of persons engaged in |

the industry, primary horsepower, capital invested, salaries, wages, cost of materials, value of products, and value added by manufacture.

Table 46 gives more detailed statistics for the industry for 1909 only.

² Statistics relate to year ending August 31.

² Includes jeans, denims, and drillings to the value of \$141,068.

³ Not reported separately.

COTTON GOODS, INCLUDING COTTON SMALL WARES—COMPARATIVE STATISTICS, BY STATES, 1909, 1904, AND 1899.

Table 45			PERSON	ns engag	ED IN IN	DUSTRY.						Ī	Value

HOSIERY AND KNIT GOODS

93426°—13——**5**

(65)

THE HOSIERY AND KNIT GOODS INDUSTRY.

GENERAL STATISTICS.

Scope of the industry.—The classification "hosiery and knit goods" covers all establishments engaged primarily in the manufacture of knit goods, irrespective of the kind of materials used. Formerly a distinction was made between those employing power in the operation of the knitting machines and those using hand machines, the statistics for the latter class of establishments being presented under the designation "hand knit goods." The distinction between the two classes of establishments, however, has lost most of its significance because the use of powerdriven machines has become almost universal, and the present report covers both classes of establishments. In 1909, 110 establishments were reported as using hand machines, these establishments manufacturing products valued at \$1,571,939, giving employment to an average of 567 wage earners, and paying out \$213,-568 in wages and \$824,991 for materials. The rela-

tively small importance of this class of establishments is indicated by the fact that they formed only 8 per cent of the total number of establishments in the industry in the United States, employed only four-tenths of 1 per cent of the total number of wage earners, and reported only eight-tenths of 1 per cent of the total value of products.

Comparison with earlier censuses.—Statistics for the hosiery and knit goods industry were first obtained at the census of 1849, when 85 establishments were reported, with products valued at \$1,028,102. In 1859, 197 establishments were reported, with products valued at \$7,280,606. Table 1 summarizes the statistics of the industry for each census from 1869 to 1909, inclusive. The financial figures for 1869 are given in currency, which at that time was worth only about 80 cents, gold, to the dollar. For strict comparison, therefore, these figures should be reduced about 20 per cent.

 $^{^{\}rm 1}$ Where percentages are omitted, comparable figures are not available.

There were in 1909, 1,374 establishments in the hosiery and knit goods industry, in which 136,130 persons were engaged, of whom 129,275 were wage earners. The amount paid in salaries and wages was \$52,431,680. The value of products was \$200,143,527; the cost of materials, \$110,241,053, equal to 55.1 per cent of the value of products; and the value added by manufacture \$89,902,474. Between 1899 and 1909 the number of wage earners increased 54.5 per cent, while the cost of materials, value of products, and value added by manufacture more than doubled. At

least part of the increase shown in cost of materials and value of products, however, is doubtless attributable to increased prices.

The growth of the industry has been continuous throughout the period covered by Table 1, each census showing substantial increases as compared with that preceding. The number of establishments reported for 1909 was more than five times as great as in 1869 and the value of products nearly eleven times as great. The greatest relative growth took place during the decade 1879-1889, each item for which comparable

² Comparable figures not available.

⁸ Figures not strictly comparable.

figures can be presented showing a greater percentage of increase for this decade than for any other covered by the table.

As the proprietors and firm members were not reported separately prior to 1899, it is probable that, in the case of small establishments, a considerable number were included with the wage earners. Salaried employees were also included to some extent with wage earners at the earlier censuses. The statistics of wage earners for the censuses of 1899, 1904, and 1909 are therefore more exactly comparable than are those for earlier censuses.

Summary, by states.—Table 2 summarizes, by states, the more important statistics of the industry, the states being arranged according to the value of products reported for 1909. In determining the rank of the states, all states are considered, whether or not they are shown separately in the table; hence some omissions occur in the several series of numbers indicating rank, as certain states included under "all

other states" held a higher rank than some of the states for which separate figures are given.

The hosiery and knit goods industry is widely distributed throughout the United States, one or more establishments being reported from 38 of the 48 states. New York is the most important state, ranking first in value of products and value added by manufacture at the censuses of both 1909 and 1904. In the number of wage earners employed, however, New York ranked second in 1909, although it ranked first in 1904. The number of wage earners employed in the industry in the state increased 35 per cent during the decade ending with 1909, and the value of products increased 86.3 per cent. In 1909 the value of products for New York represented more than one-third of the total for the industry in the United States.

Pennsylvania ranked first in the number of wage earners employed in 1909 and second in value of products and value added by manufacture. Massachusetts ranked third in all three items.

Percentages are based on figures in Table 30. A minus sign (—) denotes decrease. Percentage not shown where base is less than 100 for wage earners or less than \$100,000 for value of products or value added by manufacture, or where comparable figures can not be given without disclosing individual operations.

Of the 10 leading states in 1909 on the basis of value of products the 1 showing the largest percentage of increase from 1899 to 1909 (403.6) was North Carolina. Still higher percentages of increase, however, are shown for Tennessee and Minnesota. Vermont and South Carolina are the only states which

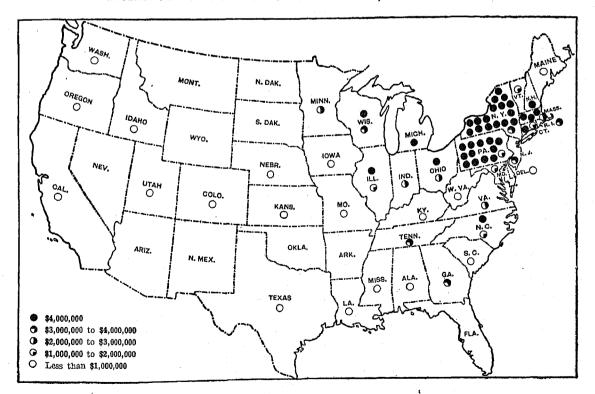

show a decrease in value of products between 1904 and 1909.

The diagram shows graphically the value of products reported for the most important states in the industry in 1909 and 1899, and the map shows the distribution of the value of products, by states, for 1909.

VALUE OF PRODUCTS FOR THE MOST IMPORTANT STATES: 1909 AND 1899.

DISTRIBUTION OF THE VALUE OF PRODUCTS, BY STATES: 1909.

PERSONS ENGAGED IN THE INDUSTRY.

Summary: 1909.—Table 3 shows for 1909 the number of persons engaged in the industry classified according to occupational status and sex, and in the case of wage earners according to age also. It should be borne in mind that the sex and age classification of the average number of wage earners in this and other tables is an estimate obtained by the method described in the Introduction.

Table 3 CLASS.	PERSONS ENGAGED IN THE HOSIERY AND ENIT GOODS INDUSTRY: 1909						
	Total,	Male.	Female.				
All classes.	136,130	43, 950	92, 180				
Proprietors and officials	3, 308	3, 125	183				
Proprietors and firm members	1, 134 799 1, 375	1,067 781 1,277	67 18 98				
Clerks	3,547	2, 398	1,149				
Wage earners (average number)	129, 275	38, 427	90,848				
16 years of age and over	118, 769 10, 506	35, 383 3, 044	83,386 7,462				

The average number of persons engaged in the industry during 1909 was 136,130, of whom 129,275, or 95 per cent, were wage earners; 3,308, or 2.4 per cent, proprietors and officials; and 3,547, or 2.6 per cent, clerks, this class including other subordinate salaried employees. Of the total number of persons engaged in the industry, 43,950, or 32.3 per cent, were males, and 92,180, or 67.7 per cent, females. Of the wage earners, 70.3 per cent were females. This is the highest percentage of female wage earners reported for any of the textile industries, the percentage in the silk manufacturing industry being 62.6; in the woolen industry 44.5; and in the cotton goods industry, 43.7. Children under 16 years of age constituted 8.1 per cent of the wage earners in the hosiery and knit goods industry, as compared with 8 per cent in the silk manufacturing industry, 5.7 per cent in the woolen industry, and 10.4 per cent in the cotton goods industry.

The average number of wage earners employed in each state in 1909, 1904, and 1899 is given in Table 30. The distribution of the average number by sex and age is not shown for the individual states, but Table 31 gives such a distribution of the number employed on December 15, or the nearest representative day. The largest number of female wage earners 16 years of age and over (28,045) was employed in Pennsylvania, and the next largest number (24,424) in New York. The largest number of wage earners under 16 years of age (4,515) was also reported from Pennsylvania, but the next largest (1,501) was in North Carolina.

Of the states in which more than 2,000 wage earners were employed in the hosiery and knit goods industry in 1909, Ohio reported the highest proportion of women 16 years of age and over in the total number of wage earners (76.5 per cent). In the other states of

this class the percentages were as follows: Michigan, 76.4; Wisconsin, 71.7; Pennsylvania, 69.5; New Hampshire, 66.7; Connecticut, 66.1; New York, 63.6; Illinois, 63.3; New Jersey, 58; Tennessee, 57.6; Georgia, 55.1; Indiana, 54.4; Massachusetts, 53.9; and North Carolina, 49.7.

The proportion of children under 16 years of age was higher in North Carolina (27.7 per cent) than in any other state employing 2,000 or more wage earners in this industry. In the other states of this class the percentages were as follows: Indiana, 19.3; Tennessee, 16.6; Georgia, 16.1; Pennsylvania, 11.2; Wisconsin, 10.6; Ohio, 7; Illinois, 6.8; New Jersey, 4.9; Massachusetts, 4.4; Connecticut, 3.1; Michigan, 2.7; New Hampshire, 1.9; and New York, 1.8.

In order to compare the distribution of the persons engaged in the industry according to occupational status in 1909 with that in 1904, it is necessary to use the classification employed at the earlier census. (See Introduction.) Such a comparison is made in Table 4.

Table 4	PERSONS ENGAGED IN THE HOSIERY AND KNIT GOODS INDUSTRY.									
CLASS.	190	09	19	Per						
VIIA55.	Number.	Per cent distri- bution.	Number.	Per cent distri- bution.	of in- crease: 1904- 1909					
Total. Proprietors and firm members. Salaried employees. Wage earners (average number).	136, 130 . 1, 134 5, 721 129, 275	100. 0 0. 8 4. 2 95. 0	109,489 1,067 4,330 104,092	100. 0 1. 0 4. 0 95. 1	24.3 6.3 32.1 24.2					

Salaried employees show the highest percentage of increase for the five-year period and proprietors and firm members the lowest.

Table 5 shows the average number of wage earners in the industry, distributed according to age, and in the case of those 16 years of age and over, according to sex, for 1909, 1904, and 1899.

Table 5	AVERAGE NUMBER OF WAGE EARNERS IN THE HOSIERY AND KNIT GOODS INDUSTRY,

Although the actual number of children reported as employed in the hosiery and knit goods industry has shown an increase at each succeeding census, the percentage which they have formed of the total number of wage earners has decreased. The percentage of females 16 years of age and over was approximately the same for 1899 and 1909, though that for 1904 was a little higher.

Wage earners classified according to nature of employment.—Table 6 gives for the United States the number of wage earners employed as spinners, knitters, and finishers, respectively, in 1909 and 1904, classified according to age and sex, with similar statistics for New York and Pennsylvania for 1909 only. It should be noted that the absolute figures for the two censuses are not strictly comparable, owing to the fact that the numbers shown for 1904 are computed averages for the entire year, while those for 1909 are the numbers reported for December 15, or the nearest representative day. The difference between the number of wage earners on this day and the average number for the year 1909, however, was only 7,438, or about 5 per cent of the total; and since there is little variation from month to month in the proportion of the different classes of employees, the figures representing the per cent distribution may be taken as fairly comparable. In 1909, of the 136,713 wage earners employed on December 15, or the nearest representative day, 2.3 per cent were employed as spinners, 26.5 per cent as knitters, and 39.4 per cent as finishers. In Pennsylvania, where, as shown by Table 21, hosiery constitutes the chief product of the industry, the distribution of the wage earners, according to occupation, is very different from that in New York, where the products are largely shirts and drawers, sweaters, cardigan jackets, etc.

Among the knitters and finishers women 16 years of age and over predominate, constituting, in 1909, 63.5 per cent of all knitters and 81.1 per cent of all finishers, but of the spinners men formed 66.3 per cent. The proportion of children under 16 years of age among spinners was 6.9 per cent, among knitters 8.9 per cent, among finishers 5.9 per cent, and among all other wage earners 10.3 per cent.

1 For 1909, the figures are those reported for December 15, or the nearest representative day; for 1904, the average number for the year is given.

2 Not including the few operatives of this class in establishments using hand machines, for which figures are not available.

Wage earners employed, by months.—Table 7 gives the number of wage earners employed in the hosiery and knit goods industry on the 15th (or the nearest representative day) of each month during the year 1909 for 21 states in which an average of 500 or more wage earners were employed during the year.

The largest number of wage earners reported as employed in the hosiery and knit goods industry during any month of 1909 was 134,540, in November, and the smallest number, 123,308, in January, the minimum number being equal to 91.7 per cent of the maximum. This industry is not subject to any material changes from one part of the year to another, the statistics

for 1904 showing even less variation from month to month than those for 1909. The maximum number in 1904, 106,203, was reported for October and the minimum number, 101,212, which was equal to 95.3 per cent of the maximum, for January.

Table 7 shows further that in each of the three principal states in the industry—New York, Pennsylvania, and Massachusetts—the greatest activity in 1909 occurred during the fall and early winter. The months of maximum and minimum employment for 1909 and the number of wage earners reported for these months are given for a larger number of states in Table 31.

I The month of maximum employment for each state is indicated by boldface figures and that of minimum employment by italic figures.

Prevailing hours of labor.—In Table 8 the wage earners in the hosiery and knit goods industry have been classified according to the number of hours of labor per week prevailing in the establishments in which they were employed. In making this classification the average number of wage earners employed during the year in each establishment has been classified as a total according to the hours prevailing in that establishment, even though a few employees worked a greater or smaller number of hours.

Of the wage earners employed in the hosiery and knit goods industry in 1909, 92.9 per cent were in establishments where the prevailing hours of labor were from 54 to 60, inclusive, per week, and 50.6 per cent were in establishments where the prevailing hours were more than 54 but less than 60 per week. In 12 of the states for which figures are given, a larger number of wage earners worked in establishments where the prevailing hours were between 54 and 60 per week than in any other group, but in 8 of the states shown the most common hours were 60 per week.

CHARACTER OF OWNERSHIP.

Includes one establishment under corporate ownership, to avoid disclosure of individual operations.

Less than one-ten th of 1 per cent.

In 1909, of the total number of establishments reported for the industry, 47.4 per cent were under corporate ownership, as compared with 41.5 per cent in 1904. There was an appreciable increase during the five-year period in the relative importance, as measured by value of products, of establishments under corporate ownership, such establishments contributing 71 per cent of the total value of products in 1909, as compared with 63 per cent in 1904.

Of the total number of wage earners reported for the industry in 1909, as shown by Table 10, 12.7 per cent were employed in establishments under individual ownership, 15.2 per cent in those under firm ownership (including the one establishment under "other" owner-

ship), and 72.1 per cent in those owned by corporations. The table also gives statistics for the hosiery and knitting mills classified according to form of ownership for 21 states in which an average of more than 500 wage earners were employed in 1909.

Note.—In some states, in order to avoid disclosing the returns for individual establishments, the figures for one group have been consolidated with those for establishments under some other form of ownership. In such cases an (X) is placed in the column from which the figures have been omitted and the figures for the group with which they have been combined are printed in italics. The figures for establishments under firm ownership include those for one establishment under cooperative ownership.

There was little variation in the several states with respect to the relative importance of establishments operated under the different forms of ownership. In the majority of the states establishments owned by corporations constituted the most important class, as measured by number of wage earners employed and value of products, those owned by firms ranking second, and those under individual ownership third. In Pennsylvania, New Jersey, and Michigan, however, the number of wage earners and the value of products for establishments under individual ownership were greater than those for establishments controlled by firms. Of the leading states in the industry, Pennsylvania had the largest proportion of establishments under individual ownership, namely, 39.9 per cent.

SIZE OF ESTABLISHMENTS.

Classification by value of products.—Table 11 presents statistics for 1909 and 1904 for hosiery and knitting mills grouped according to the value of their products.

In comparing the figures shown for 1909 and 1904 in the foregoing table, it should be noted that by reason of advance in prices of materials and products an establishment might pass from a lower to a higher class without a corresponding increase in the quantity of its output.

Table 11	HOSIERY AND KNIT GOODS INDUSTRY.

¹ Includes one establishment with products valued at \$100,000 and less than \$1,000,000 to avoid disclosure of individual operations.

Of the 1,374 hosiery and knitting mills reported for 1909, 25, or 1.8 per cent, manufactured products valued at \$1,000,000 or over. In 1904 there were 11 establishments of this class out of a total of 1,144. While such establishments represented an insignificant proportion of the total number at both censuses, they reported 18.5 per cent of the total value of products of the industry in 1909 and 11 per cent in 1904. On the other hand, the small establishments—that is, those manufacturing products valued at less than \$20,000—constituted more than one-quarter (25.5 per

cent) of the total number of establishments in 1909, but the value of their products amounted to only 1.5 per cent of the total. Both in 1909 and 1904 the greater part of the products of the industry were manufactured in establishments with products valued at from \$100,000 to \$1,000,000, such establishments reporting 66.4 per cent of the total value of products for the industry in 1909 and 70.5 per cent in 1904.

The average value of products per establishment increased from \$119,822 in 1904 to \$145,665 in 1909, and the average value added by manufacture, as com-

puted from the figures in Table 1, from \$52,699 to \$65,431. The increase in these averages was due, in part, to the increase in the prices of materials and products. The average number of wage earners per establishment increased from 91 in 1904 to 94.1 in 1909.

Classification by number of wage earners.—Table 12 gives a classification, according to the number of wage earners employed, in the hosiery and knitting mills in 21 states in which an average of more than 500 wage earners were employed in 1909.

Of the 1,374 establishments reported for 1909, 31, or 2.3 per cent, employed no wage earners, 33.9 per cent employed from 1 to 20 wage earners, 37.9 per cent from 21 to 100, 23.5 per cent from 101 to 500, and 2.4 per cent more than 500.

Of the total number of wage earners employed, 3.4 per cent were reported by establishments employing from 1 to 20 wage earners, 20.6 per cent by establishments employing from 21 to 100, 52.6 per cent by establishments employing from 101 to 500, and 23.4 per cent by establishments employing more than 500 wage earners. Most of the establishments employing over 500 wage earners were situated in New York, Pennsylvania, and Massachusetts.

EXPENSES.

As stated in the Introduction, the census figures for expenses do not purport to represent the total cost of manufacture, since they take no account of interest or depreciation; hence they can not properly be used for determining profits. Facts of interest can be brought

out, however, concerning the relative importance of the different classes of expenses which were reported. Table 1 shows the total expenses reported for hosiery and knitting mills in 1909 to have been \$175,729,583, distributed as follows: Cost of materials, \$110,241,053, or 62.7 per cent; wages, \$44,740,223, or 25.5 per cent; salaries, \$7,691,457, or 4.4 per cent; and miscellaneous expenses, made up of advertising, ordinary repairs of buildings and machinery, insurance, traveling expenses, and other sundry expenses, \$13,056,850, or 7.4 per cent.

Table 13 shows, by states, for 1909, the per cent distribution of the expenses reported for the hosiery and knit goods industry.

The differences among the states with respect to the proportions which the cost of materials and wages, respectively, formed of the total reported expenses are attributable largely to differences in the character of materials used and to differences in the degree of fineness and elaboration of the products. The cost of materials is likely to form a smaller proportion and

wages a higher proportion of the total expenses in establishments which do their own spinning than in establishments that buy the yarn which they use for knitting.

The percentage that the cost of materials formed of the total expenses reported varies considerably in the different states, being highest in Utah (74.9) and Rhode Island (72.3) and lowest in California (45.8), Indiana (48), and Maine (49.8). For New York the percentage was 64.7; for Pennsylvania, 62; and for Massachusetts, 56.7. In Massachusetts the mills use relatively more raw cotton and less purchased cotton yarn than in Pennsylvania and New York.

ENGINES, POWER, AND FUEL.

Engines and power.—As shown by Table 1, the amount of power used in the industry increased from 6,498 horsepower in 1869 to 103,709 in 1909. Table 14 shows the statistics of power as reported at the censuses of 1909, 1904, and 1899.

The total primary power used in the hosiery and knitting mills increased from 57,346 horsepower in 1899 to 103,709 horsepower in 1909, or 80.8 per cent. In 1909, as in 1904 and 1899, the power of steam engines constituted by far the larger part of the total primary power. Water power, which formed 25.8 per cent of the total primary power in 1899, consti-

tuted only 11.6 per cent of the total in 1909. There was a marked increase during the decade, on the other hand, in the relative importance of electric motors operated by purchased current (rented electric power), the total horsepower of such motors increasing from 1.304, or 2.3 per cent of the total primary power, in 1899, to 13,286, or 12.8 per cent of the total, in 1909. The number and horsepower of electric motors used for applying power by means of current generated in the establishments reporting also show very large increases.

¹ Not reported.

Table 15 shows for 1909 the amount of each of the several kinds of power and of the different kinds of fuel used in the industry in the 21 states for which statistics have been presented in previous tables.

The states which ranked highest with respect to the amount of power used were New York, Pennsylvania, and Massachusetts, the total horsepower reported for these states in 1909 being 66,792, or 64.4 per cent of the aggregate for all hosiery and knitting mills in the United States. Steam was the most important form of power in all of the states shown separately with the exception of New Hampshire, where water power formed 65.1 per cent of the total primary power. New York exceeds any other state in the horsepower of steam engines, water wheels, electric motors, and gas and other internal-combustion engines.

 $^{^{\}rm 2}$ Less than one-tenth of 1 per cent.

Fuel consumed.—Owing to the extensive use of water power in the hosiery and knit goods industry, less fuel is consumed in generating power than would otherwise be required. As shown by Table 15, bituminous coal was the principal fuel used, 441,187 short

tons being consumed during 1909. The largest quantity of anthracite coal, 72,667 long tons, or more than one-half the total consumed in the industry, was reported for Pennsylvania. Gas was used to some extent, the largest quantity being reported for New York.

SPECIAL STATISTICS RELATING TO MATERIALS, PRODUCTS, AND EQUIPMENT.

MATERIALS.

Summary for the United States.—Table 16 shows statistics of the materials used in the hosiery and knit goods industry for 1909, 1904, and 1899.

Most of the mills in the hosiery and knit goods industry purchase the yarn which they use instead of spinning it themselves. This is shown by the fact that in the case of cotton yarn, the principal material used in the industry, the weight of the purchased yarn used in 1909 was more than three times as great as the weight of the yarn made by establishments in the industry for their own use, and that the combined weight of the purchased worsted and woolen yarns used was nearly twice as great as that of such yarns made by the establishments in the industry for their own use, although for woolen yarns alone the quantity made in the establishment using was somewhat greater than that purchased. In the case of merino yarn, however, the quantity made by the establishments in the industry for their own use was more than five times as great as the quantity purchased. The total cost of purchased yarns of all classes in 1909 shown in the table was \$68,389,818, or 62 per cent of the cost of all materials, while the cost of the raw cotton and wool used represented 10.6 per cent of the total cost of materials.

1 Not reported.

The total cost of the materials used in the industry increased 115.3 per cent from 1899 to 1909. The amount of raw cotton consumed in the industry shows an increase of 25,964,722 pounds, or 52.5 per cent. between 1899 and 1909, while its cost more than doubled; the increase in consumption, however, took place mainly during the five-year period 1904-1909. the increase for the period 1899-1904 amounting to only 1,135,459 pounds, or 2.3 per cent. Wool, on the contrary, shows a considerable decrease for the decade, amounting, on the scoured basis, to 7,448,469 pounds, or 57.2 per cent; this decrease, however, was confined entirely to the second half of the decade, the consumption increasing somewhat between 1899 and 1904. Shoddy and wool waste and noils show an increase from 1899 to 1909, although shoddy shows a slight decrease between 1904 and 1909.

There was a marked increase during the decade in the quantity of all kinds of purchased yarns used, that for cotton yarn amounting to 85,167,543 pounds, or 64.6 per cent; that for worsted yarns to 4,546,789 pounds, or 78.1 per cent; that for merino yarns to 2,033,125 pounds, or 102.6 per cent; and that for silk yarns to 716,506 pounds, or 269.1 per cent. In the case of yarns made for use in the same establishment, figures for prior censuses are available only for cotton yarn, the quantity of which increased 69.3 per cent from 1899 to 1909. In 1909, as already stated, the amount of purchased cotton yarn used was more than three times as great as the amount spun for use in the same establishment; the proportion of purchased yarn was, however, smaller in that year than in either 1904 or

Table 16 does not cover the materials used by establishments in other industries which manufactured hosiery and knit goods as subsidiary products. A number of these establishments, manufacturing hosiery and knit goods to the value of \$1,773,291 in 1909, are included under other industries of the textile group, and their total consumption of cotton, silk, and wool, or of yarns, as the case may be, is included in the statistics for the industries to which these establishments belong. In 1909, however, approximately 600,000 pounds of scoured wool and considerable quantities of cotton, animal hair, etc., and yarns were used by establishments in nontextile industries which manufactured hosiery and knit goods as subsidiary products.

Materials used, by states.—Table 17 presents statistics of the principal materials used in the industry, by states.

Includes 3,429,494 pounds of Egyptian or other foreign cotton, costing \$526,001.
 Included in figures for "all other states," to avoid disclosure of individual operations.
 Includes for 1909, 472,707 pounds of foreign wool, costing \$252,419; for 1904, 1,130,433 pounds; and for 1899, 3,446,838 pounds.

New York was the leading state in the use of raw cotton in all three years, with Massachusetts second. Connecticut and New Hampshire both show a decrease in the amount used in 1909 as compared with 1899.

A decrease in the amount of wool used took place between 1899 and 1909 in every state for which figures are given in the table. New York used more raw wool than any other state, the consumption in 1909 in this state amounting to 27.8 per cent of the total for the industry in the United States.

The greater part of the shoddy, mungo, and wool extract reported (more than one-half in each of the three years covered by the table) was reported from New York. More than one-half of the total amount of purchased wool waste and noils used in the industry in 1909 (4,398,579 pounds) was also reported from New York.

Of the total amount of purchased yarns used in the industry in 1909 (238,736,996 pounds), 94,455,289 pounds, or 39.6 per cent, was reported from New York. Pennsylvania ranked second in this respect, with 61,995,291 pounds, or 26 per cent of the total.

Of the purchased cotton yarn used in 1909, 39.9 per cent was used in New York and 27.2 per cent in Pennsylvania. Every state for which statistics as to this material are given in the table shows an increase between 1899 and 1909 in the quantity used, the largest relative increases being in Ohio (873.1 per cent) and North Carolina (345.9 per cent).

Of the purchased woolen yarn used in the industry in 1909, slightly more than one-half (51.9 per cent) was reported from New York. With the exception of Massachusetts, which shows a slight decrease, all the states listed in the table show gains in consumption for the decade, the largest relative increases being in Ohio, where the consumption in 1909 was nearly twelve times that in 1899, and New York and New Jersey, where the consumption in 1909 was more than three and one-half times as great as in 1899. New York also led the states in the use of purchased worsted yarn in 1909, its consumption in that year being more than twice as great as in 1899.

Table 18 gives statistics as to the other materials used in the industry, by states, for 1909.

PRODUCTS.

Summary for the United States.—Table 19 shows the products of the hosiery and knit goods industry in the United States, as reported at the censuses of 1909, 1904, and 1899.

Of the total value of products of the industry in 1909, that of hosiery constituted 34.3 per cent; that of shirts, drawers, and combination suits, 42.2 per cent; that of sweaters, cardigan jackets, etc., 11.2 per cent; that of gloves and mittens, 3.6 per cent; and that of all other products, 8.6 per cent. In the case of each of the classes of hosiery, as well as of shirts and drawers and combination suits, the cotton product predominated as to both quantity and value.

Cotton hosiery constituted 91.2 per cent of the total output of hosiery in 1909, as compared with 88.2 per cent in 1899. Of the cotton hosiery manufactured in 1909, 43.3 per cent consisted of half hose. Woolen and worsted hosiery constituted only 3.5 per cent of the total output in 1909, and of such hosiery, 47.6 per cent was half hose. Most of the merino hosiery consisted of half hose.

Of the shirts and drawers made in 1909, 89.1 per cent were cotton and 10 per cent merino or mixed.

The total production of hose and half hose increased from 29,903,899 dozen pairs in 1899 to 62,825,069 dozen pairs in 1909, a gain of 110.1 per cent, while the value of this class of products increased 150.6 per cent. The production of silk hose, which aggregated only

12.572 dozen pairs in 1899, amounted to 434,414 dozen pairs in 1909. There was comparatively little increase | ing the decade.

in the production of woolen and worsted hosiery dur-

1 A minus sign (—) denotes decrease.
2 In addition, hosiery and knit goods to the value of \$2,975,749 were made in 1909 by establishments in the following industries: Boots and shoes, rubber; clothing, men's, including shirts; clothing, women's; cotton goods, including cutton small were; gloves and mittens, leather; hats and caps, other than felt, straw, and wool; millinery and lace goods; silt and silk goods, including throwsters; woolen, worsted, and felt goods, and wool hats. In 1904 products to the value of \$1,579,633 were made by establishments not engaged primarily in the manufacture of hosiery and knit goods.
3 Includes products to the value of \$1,028,907, the character of which pertains to the following industries: Boxes, fancy and paper; clothing, men's, including shirts; clothing, women's; dyeing and finishing textiles; fancy articles, not elsewhere specified; gloves and mittens, leather; hats and caps, other than felt, straw, and wool; instruments, professional and scientific; photographic apparatus and materials; waste; and woolen, worsted, and felt goods, and wool hats.

The production of shirts and drawers of all classes increased from 15,873,700 dozens in 1899 to 25,337,779 dozens in 1909, a gain of 59.6 per cent. The relative increase in the value of the product, however, was somewhat less (52.4 per cent)—a fact attributable to a change in the proportions represented by the different classes, as for each separate class, with the exception of cotton, the percentage of increase in value was greater (or the percentage of decrease less) than that in quantity, while for cotton shirts and drawers the relative increases in quantity and value were approximately the same. The production of all-wool shirts and drawers declined greatly during the decade, and that of silk and silk mixed and of merino and merino mixed was substantially the same in 1909 as in 1899, although greater than in 1904, but the production of cotton shirts and drawers increased 87.1 per cent.

There was an increase of 150.6 per cent between 1899 and 1909 in the production of combination suits,

all classes, with the exception of silk and silk mixed, showing an increase. The highest percentage of gain (427.3) was reported for the all-wool varieties.

There was a very great increase during the decade in the production of sweaters, cardigan jackets, etc., and of hoods, scarfs, nubias, etc., and a considerable increase in the production of knit gloves and mittens and shawls, but a decrease in the output of boot and shoe linings.

The yarns manufactured for sale in the hosiery and knit goods industry in 1909 had a value of \$1,785,531, representing an increase of 258 per cent as compared with that in 1899. Of the total value in 1909, 87.8 per cent represented that of cotton yarn and 12.2 per cent that of woolen, worsted, and merino yarns. The output of cotton yarn for sale shows an increase of 208.2 per cent for the decade, and that of woolen, worsted, and merino yarns an increase of 263 per cent.

¹ These industries include boots and shoes, rubber; clothing, men's, including shirts; clothing, women's; cotton goods, including cotton small wares; gloves and mittens, leather; hats and caps, other than felt, straw, and wool; millinery and lace goods; silk and silk goods; woolen, worsted, and felt goods, and wool hats.

² Includes products to the value of \$1,028,907, chargeable to the following industries: Boxes, lancy and paper; clothing, men's, including shirts; clothing, women's; dyeing and finishing textiles; fancy articles, not elsewhere specified; gloves and mittens, leather; hats and caps, other than felt, straw, and wool; instruments, professional and scientific; photographic apparatus and materials; waste; woolen, worsted, and felt goods, and wool hats.

Table 20 shows, for 1909, the quantity and value of the principal classes of hosiery and knit goods, so far as reported separately, manufactured, respectively, in all industries combined, in the hosiery and knit goods industry, and in other industries.

The total value of products reported for the hosiery and knit goods industry in 1909 (\$200,143,527) includes \$2,814,438 representing the value of products other than hosiery and knit goods and of yarns, which class of products are usually the primary products of other industries. The subtraction of this latter figure from the total value of products for the industry leaves a remainder of \$197,329,089, which represents approximately the value of the hosiery and knit goods made in the industry. On the other hand, hosiery and knit goods to the value of \$2,975,749 were reported by establishments engaged primarily in the manufacture of other products, although this may not represent the total production of hosiery and knit goods outside the hosiery and knit goods industry, as some establishments making these products may not have reported them separately. Adding together the two figures just given, a total of \$200,304,838 is obtained, which represents approximately the total value of the strictly hosiery and knit goods manufactured in 1909, whether in the hosiery and knit goods industry or in other industries.

Products, by states.—Table 21 shows the different products of the industry in 1909, 1904, and 1899, by states.

Of the hosiery manufactured in the United States in 1909, Pennsylvania produced 27,832,601 dozen pairs,

or 44.3 per cent; Massachusetts, 4,506,960 dozen pairs; and Georgia, 3,726,330 dozen pairs. Wisconsin shows the largest percentage of increase in production for the decade 1899–1909 (260.8), Georgia following with 211.7. Connecticut, New Jersey, and Ohio show a decrease in production for the five-year period 1904–1909, although the output in 1909 was in each case somewhat greater than that in 1899.

Of the total output of cotton hosiery manufactured in the United States in 1909, Pennsylvania produced 27,139,582 dozen pairs, or 47.4 per cent. New York, the leading state in the hosiery and knit goods industry as a whole, produced only an insignificant quantity of cotton hose. Wisconsin shows the largest percentage of increase from 1899 to 1909 (487.7), although that for North Carolina is nearly as great (442.9). New Jersey is the only state listed in the table which shows a decrease between 1899 and 1909; all of this decrease, however, took place in the five-year period 1904–1909.

In the manufacture of woolen and worsted hosiery New Hampshire is the leading state, producing 44.5 per cent of the entire output in 1909. Pennsylvania showed an increase of 107 per cent in 1909 as compared with 1899, which is the highest rate of increase reported for any state. As compared with 1904, however, the production in 1909 represented a decrease of 14.6 per cent. Wisconsin also showed a decrease in output in 1909 as compared with 1904, although the production was slightly larger in 1909 than in 1899.

¹ Included in figures for "All other states," to avoid disclosure of individual operations.

In the manufacture of merino hosiery New Hampshire, Michigan, Illinois, Rhode Island, Ohio, and Connecticut were the six leading states. Of the states for which figures are given in Table 21, New Hampshire and Ohio show large increases in production for the decade, while Pennsylvania shows a decrease, all of this decrease, however, taking place during the five-year period 1899–1904.

In the manufacture of silk hosiery, Pennsylvania is the leading state, producing, in 1909, 33.5 per cent of the total output reported for the United States.

Of the total output of shirts and drawers in 1909, New York produced 49.2 per cent. Pennsylvania was the second state in importance in the manufacture of these products, reporting 26.5 per cent of the total; in the production of merino or mixed garments, however, Pennsylvania ranked only fifth.

New York and Pennsylvania are also the leading states in the production of combination suits. Massachusetts, Ohio, and New Hampshire are, however, the leading states in the production of merino or mixed suits, New York and Pennsylvania both showing a slight decrease in the production of such suits for the decade as a whole, although an increase for the five-year period 1904–1909.

New York is the leading state in the manufacture of sweaters, cardigan jackets, etc., reporting 74.6 per cent of the total output in 1909. Wisconsin is the only one of the states for which figures are presented in the table showing an increase between 1899 and 1909 of less than 100 per cent.

New York contributed nearly 50 per cent of the total output of knit gloves and mittens in the United States in 1909; Wisconsin ranked second in quantity of output, while Pennsylvania ranked second in the value of the product. Wisconsin and Michigan show decreases in output for the five-year period 1904–1909, although Wisconsin shows a small increase for the decade as a whole.

In the manufacture of hoods, scarfs, nubias, and similar articles, Wisconsin and Ohio are the leading states. Ohio reported over one-half of the output of knit shawls in 1909 and nearly three-fourths in 1904. New York produces the bulk of the knit leggings and gaiters and Pennsylvania and New York the bulk of the fancy knit goods, wristers, etc. Practically all of the knit fabric used for boot and shoe linings is made in Rhode Island and Connecticut. Pennsylvania, Massachusetts, and New York are the leading states in the manufacture of eider down goods, while New York produced nearly two-thirds of the Jersey cloth and stockinet.

In 1909 the leading states reporting cotton yarn made for sale were New York, Massachusetts, and Illinois, while the bulk of the woolen, worsted, and merino yarns made for sale was reported from Pennsylvania.

In addition to the products listed separately in Table 21, miscellaneous products to the value of \$4,954 708 were reported as manufactured in 1909. Among the more important of these products were bathing suits, athletic suits, women's skirts, waists and sacques, towels and face cloths, stocking feet, glove linings, etc.

Table 22 shows the number of establishments in the hosiery and knit goods industry in 1909 which dyed and finished their goods, the number of establishments that dyed or finished goods owned by others, as well as their own product, and the number that did custom spinning and knitting. Some dyeing and finishing is done for establishments in this industry by establishments in other industries, particularly those engaged in the dyeing and finishing of textiles.

Table 23 shows, by geographic divisions, for the censuses of 1909, 1904, and 1899, the output of hosiery, of shirts and drawers, of combination suits, of cardigan jackets, sweaters, etc., and of gloves and mittens, and the value of all other products, as reported by establishments in the hosiery and knit goods industry.

The Middle Atlantic division is the leading division in the manufacture of hosiery and knit goods, as measured by total value of products, and also ranks first in the production of each class of products shown separately in the table. The New England division ranked second in total value of products in 1909, the East North Central third, and the South Atlantic fourth. The South Atlantic division, however, ranked second in 1909 in the output of hosiery, and third in that of shirts and drawers, showing increases of 221.5 per cent and 53.2 per cent, respectively, for the decade. In 1899 the New England division outranked the South

Atlantic in the manufacture of hosiery, but by 1904 it | Central, the two South Central, and the Mountain had dropped to third place in this respect. The indus-

try is comparatively unimportant in the West North | for the decade are shown for all these divisions.

EQUIPMENT.

Wool-combing machines.—Six wool-combing machines were reported as used in the industry in 1909, three of American manufacture in Massachusetts, and three of foreign manufacture in Illinois. Wool-combing machines were not reported separately in 1904 and 1899, but only the total number of combing machines, while at the census of 1909 the number of wool-combing machines and not the total number of combing machines was reported.

Cards and spindles.—Table 24 shows the number of cards and spindles used in 1909, 1904, and 1899 in the hosiery and knit goods industry in the United States.

At the census of 1899 the number of sets of cotton, worsted, and shoddy cards was not reported. The decrease in the number of woolen and worsted cards and spindles and the increase in that of cotton cards and spindles is a marked feature of the statistics. In 1904 the number of cotton cards and of spindles was approximately the same as for woolen, worsted, and shoddy cards and spindles combined, but in 1909 cotton

cards and spindles constituted two-thirds of the respective totals. During the decade 1899–1909 the number of cotton spindles increased 277,375, or 134.8 per cent, while that of woolen and worsted spindles decreased 57,612, or 18.9 per cent.

¹ Includes 785 sets of woolen cards, 10 of worsted, and 59 of shoddy.
² Includes 241,699 woolen, 2,380 worsted, and 900 shoddy spindles.

The woolen cards and spindles are largely concentrated in New York and Connecticut. There were 416 sets of woolen cards in New York in 1909, as compared with 491 in 1904 and 674 in 1899; and 114 in Connecticut, as compared with 109 in 1904 and 134 in 1899. Of the total number of sets of cotton cards in 1909, New York and Massachusetts reported nearly two-thirds, and of the total number of producing spindles of all kinds these states reported 63.9 per cent.

Table 26 shows, for 1909, by states, the number of establishments reporting producing spindles and the

number which did not, and also the number of producing spindles and the number of mills having 4,000 or more such spindles each, with the aggregate number of spindles in such mills.

New York reported 66 establishments with producing spindles and 18 of them had more than 4,000 spindles each. Of 37 establishments in New Jersey only 1 reported the operation of spindles, and in Pennsylvania, which had the largest number of establishments of any of the states (464), only 9 establishments reported spindles.

Includes 291,494 cotton and 1,859 woolen spindles.
 Includes 2,096 woolen, 1,055 worsted, and 3,688 cotton spindles.

Knitting machines.—Table 27 gives, for the United States, the number of the different kinds of knitting machines reported at the censuses of 1909, 1904, and 1899. Machines in establishments in other industries

are not included in the table, but the number of such machines in 1909 is shown in the footnote.

In 1909 the total number of knitting machines reported by establishments in the industry was 115,019, as against 69,047 in 1899, an increase of 45,972, or 66.6 per cent. Over 96 per cent of all the knitting machines in 1909 were power machines. There was an increase of 3,167, or 21.8 per cent, in the number of spring-beard needle machines between 1899 and 1909, while the increase in the number of latch needle machines was 42,805, or 78.5 per cent. Latch needle machines constituted 84.6 per cent of the total number of machines in 1909, as compared with 79 per cent in 1889.

Circular and circular hosiery automatic machines formed 80.7 per cent of the total number in 1909 and 78.4 per cent in 1899, the proportion of circular hosiery machines increasing from 31.4 per cent of the total number in 1899 to 38.8 per cent in 1909, while that of circular machines fell during the same period from 47 per cent to 41.9 per cent.

Table 28 gives, by states, the knitting-machine equipment of the mills in 1909.

¹ In addition, 32 establishments manufacturing hosiery and knit goods as secondary products, reported 1,232 knitting machines, comprising 69 flat power machines, 586 circular, 326 circular hosiery, 112 miscellaneous power machines, and 139 hand machines. Of the 1,232 machines, 307 were spring-beard needle and 925 were latch needle machines.

Not reported.

Not reported.
Not including machines used by manufacturers employing hand machines exclusively, which were not reported in 1904 and 1899.

In 1909 Pennsylvania reported nearly two-fifths of the total number of knutting machines, one-half of the circular automatic hosiery machines, and one-third of the circular machines (ribbed and plain combined). New York reported about one-eighth of the total number and one-fifth of the circular (ribbed and plain) machines, but only a small proportion of the automatic circular hosiery machines.

Sewing machines.—Table 29 gives the number of sewing machines employed in the industry in 1909, 1904, and 1899, and shows, by states, the number in 1909.

The total number reported increased 78.9 per cent during the decade 1899–1909. New York and Pennsylvania together reported more than two-thirds of the total for 1909.

DETAILED STATE TABLES.

The principal statistics secured by the census inquiry concerning the hosiery and knitting mills are presented, by states, in Tables 30 and 31.

Table 30 shows, for 1909, 1904, and 1899, the number of establishments, number of persons engaged in the

industry, primary horsepower, capital invested, salaries, wages, cost of materials, value of products, and value added by manufacture.

Table 31 gives more detailed statistics for the industry for 1909 only.

MANUFACTURES.
